Technical Support Number: 781-433-9603

Technical Support Fax: 781-449-9520

Comments and Suggestions

Customer satisfaction is extremely important to Cantata Technology. We value your comments and suggestions about how we could improve this documentation. Please complete and fax this form to 1-508-862-3020 (Attention: Technical Publications Manager).

Are the hyperlinks in the electronic copies useful?

What tasks are you performing most often when you have to refer to the documentation?

Do the steps in the documentation match the steps you take when using the CSP? If not, explain:

Is the most important information prominent, or do you have to dig for it?

Does the documentation help you to make specific decisions about how to use our products?

What additional graphics would be useful in helping you to understand how to use our products?

Is the documentation visually appealing?

Is terminology consistent and industry-standard?

How could we re-organize our documentation to make it easier for you to use?

Could we change the table of contents to help you find information more quickly?

How else can we make our documentation more useful for you?

Was the document in your preferred language?

Was the document readily available?

Please rate the following: 5 = Excellent 4 = More than satisfactory
 3 = Satisfactory 2 = Less than satisfactory
 1 = Unsatisfactory N/A = Not Applicable

About this Information Product

Purpose

This documentation provides guidelines for using the Excel Converged Services Platform (CSP).

Safety Labels

The following Safety labels may appear in this information product to alert customers to avoidable hazards. The following are in the order of priority:

DANGER

Danger indicates the presence of a hazard that will cause death or severe personal injury if the hazard is not avoided.

WARNING

Warning indicates the presence of a hazard that can cause death or severe personal injury if the hazard is not avoided.

CAUTION

Caution indicates the presence of a hazard that will or can cause minor personal injury or property damage if the hazard is not avoided.

Caution can also indicate the possibility of data loss, loss of service, or that an application will fail.

Conventions used

This information product uses the text conventions explained below. In addition, hexadecimal numbers are preceded by a zero and small “x.” For example, the decimal number 15 is represented in hexadecimal as 0x0F.

Convention	Description
→	In documentation related to a graphical user interface (GUI), the right arrow indicates you must click for another menu choice. Example: Go to the Configuration menu and select Card->Span Configuration.
...	In documentation related to GUI, a horizontal ellipsis in the description of a title bar of a dialog box denotes that the remaining part of the title bar is created dynamically. A horizontal ellipsis in an API message indicates fields of variable length.
...	A horizontal ellipsis in an API message indicates fields of variable length.
:	A vertical ellipsis in an API message indicates that a block of information is repeated or is variable.
<i>n</i>	The letter <i>n</i> is a generic placeholder for a number.
Sans serif mono space	Indicates a command name, option, input, output, non-GUI error, and system messages.
<i>Sans serif monospace italic</i>	Indicates a parameter name in an input message. Example: move *.dot a: c: -s The -s is the parameter.
<i>Serif italic</i>	Indicates the name of a book, chapter, path, file, or API message. Example: <i>UserDirectory/Config.exe</i>
Boldface	Indicates keyboard keys, key combinations, and command buttons Example: Ctrl+Alt+Del
Sans serif boldface	Identifies text that is part of a graphical user interface (GUI). Example: Go to the Configuration menu and select Card→Span Configuration

Industry Standards

This documentation contains many references to ITU-T standards. Originally, the CCITT made international standards for modulation, data transfer, and data compression protocols. The CCITT later became the ITU-T, or International Telecommunications Union Telecommunication Standardization Sector. CCITT standards are synonymous with ITU-T standards. For more details on these standards, go to www.itu.org.

This documentation also refers to American National Standards Institute (ANSI) standards. ANSI administers and coordinates the U.S. voluntary standardization and conformity assessment system for the telecommunications industry. More details on these standards may be viewed at www.ansi.org.

Related Training

Cantata Technology offers a variety of training courses for the Excel CSP. Instructors present a comprehensive description of hardware and software components and their interaction. Laboratory sessions provide hands-on experience for developing efficient, robust telecommunication.

For information, call 1-508-862-3000 and ask for a Training representative.

Contacting Technical Support for Hardware Failures

To expedite the process of returning defective hardware, please provide the serial number of the card and a shipping address.

Technical Support investigate to determine whether a card may be defective, or if it is instead exhibiting a software issue that can be confused as a hardware problem. An example of an indication of a hardware defect would be an LED that fails to display any status. Examples of problems that do not indicate hardware defects include the following:

- Software faults (probably a software defect issue)
- A card that arrives “dead” (probably a dip switch set incorrectly)
- A card not coming into service during software downloading (probably a TFTP issue)
- Spans not framing (probably a wiring issue)
- Power card LEDs blink when no other cards are in the chassis. This is normal.

Recommendations for System Supportability

The following are key elements we have identified across our customer base that have made them successful in their development and deployment of solutions incorporating Cantata Technology products. We are passing these onto you as suggestions to consider when designing and building solutions. Not all of these suggestions are appropriate for all customers, but we hope you consider them carefully.

If Your Solution Requires High Availability:

- Order redundant configurations
- Purchase onsite spares
- Follow the limitations for power, cards, and configurations as noted in the Cantata Product Documentation
- Have your developers and technicians trained on the Cantata CSP platform
- Enable logging in your application so that problems can be diagnosed and corrected
- Develop test scripts, environments, and systems that best simulate the environment of intended use for each release and each fix you deliver to your customers
- Implement Software Configuration Management to track every revision and change that you release to your customers
- Review your call flows and APIs with Cantata Technical Support to identify opportunities to optimize your solution with regard to our product capabilities
- Purchase a support agreement from Cantata Technology

If you are running a network with Cantata Products in them, in addition to the above suggestions, also:

- Have backup systems for power
- Review your network design with Cantata Technical Support to identify opportunities to optimize your solution with respect to our product capabilities
- Design your network to allow for alternative routes and logical assignments to more quickly address any service affecting issues.
- Control your system environment and configuration changes
- Plan your network management and monitoring strategy
- Ensure that your technicians are trained in all network elements and interfaces
- Monitor your network every day, around the clock.
- Have the ability to get someone to every site without delay
- Have a complete list of contact information for the support arm of each network element you deploy
- Provide for supplier remote access if required to diagnose and resolve an issue

All of us at Cantata Technology want you, our valued customer, to be successful. For additional information regarding our support services and how we can work more closely together for our mutual success, contact us at our support website at <http://www.cantata.com/support> or contact a sales representative at sales@cantata.com.

Cantata Technology Excel Product Line Warranty

Unless otherwise stated in an applicable product purchase agreement between the Customer and Cantata Technology, Inc. ("Cantata"), Cantata warrants that during the Warranty Period, products will operate in substantial conformance with Cantata's standard published documentation accompanying the product. If a product does not operate in accordance therewith during the Warranty Period, the Customer must promptly notify Cantata. Cantata, at its option, will either repair or replace the product without charge. The Customer has the right, as their exclusive remedy, to return the product for a refund of purchase price or license fee if Cantata is unable to repair or replace it.

Warranty Period

The period for which the warranty shall apply (the "Warranty Period") with respect to Cantata's Excel-branded products or software shall be:

- 12 months for new hardware purchases;
- 90 days for software defects;
- 90 days for hardware repairs for products for which the original Warranty Period has expired; and
- 30 day "out-of-box" failure expedited replacement for inoperative new hardware

The Warranty Period begins on the date of shipment of any products or software by Cantata.

The Warranty Period for repaired, replaced or corrected products and software shall be coterminous to the Warranty Provided for the original products or software purchased.

To report warranty claims, Customer may contact Cantata via email at techsupport@cantata.com or call (781) 433-6900.

Warranty Provisions

A. During the Warranty Period, Cantata warrants to Customer only that:

- (i) Products manufactured by Cantata (including those manufactured for Cantata by an original equipment manufacturer) will be free from defects in material and workmanship and will substantially conform to specifications for such products;
- (ii) software developed by Cantata will be free from defects which materially affect performance in accordance with the specifications for such software. With respect to products or software or partial assembly of products furnished by Cantata but not manufactured by Cantata, Cantata hereby assigns to Customer, to the extent permitted, the warranties given to Cantata by its vendors of such items.

B. If, under normal and proper use, a defect or non conformity appears in warranted products or software during the applicable Warranty Period and Customer promptly notifies Cantata in writing during the applicable warranty period of such defect or non conformance, and follows Cantata's instructions regarding return of such defective or non conforming Product or Software, then Cantata will, at no charge to Customer, either:

- (i) repair, replace or correct the same at its manufacturing or repair facility or
- (ii) if Cantata determines that it is unable or impractical to repair, replace or correct the product or software, provide a refund or credit not to exceed the original purchase price or license fee.

C. No product or software will be accepted for repair or replacement without the written authorization of and in accordance with instructions from Cantata. Removal and reinstallation expenses as well as transportation expenses associated with returning such product or software to Cantata shall be borne by Customer. Cantata shall pay the costs of transportation of the repaired or replaced product or software to the destination designated in the original Order. If Cantata determines that any returned product or software is not defective, Customer shall pay Cantata's costs of handling, inspecting, testing and transportation. In repairing or replacing any product, part of product, or software medium under this warranty, Cantata may use new, remanufactured, reconditioned, refurbished or functionally equivalent products, parts or software media. Replaced products or parts shall become Cantata's property.

D. Cantata makes no warranty with respect to defective conditions or non conformities resulting from any of the following: Customer's modifications, misuse, neglect, accident or abuse; improper wiring, repairing, splicing, alteration, installation, storage or maintenance performed in a manner not in accordance with Cantata's or its vendor's specifications, or operating instructions; failure of Customer to apply Cantata's previously applicable modifications or corrections; or items not manufactured by Cantata or purchased by Cantata pursuant to its procurement specifications. Cantata makes no warranty with respect to products which have had their serial numbers removed or altered; with respect to expendable items, including, without limitation, fuses, light bulbs, motor brushes and the like; or with respect to defects related to Customer's data base errors. Improper packaging of product for repair will not be covered under this warranty agreement. No warranty is made that software will run uninterrupted or error free.

E. Warranty does not include:

- a) Cantata's assistance in diagnostic efforts;
- b) access to Cantata's Technical Support web sites, databases or tools;
- c) product integration testing;
- d) on-site assistance; or
- e) product documentation updates.

These services are available either during or after warranty at Cantata's published prices.

F. THE FOREGOING WARRANTIES ARE EXCLUSIVE & ARE GRANTED IN LIEU OF ALL OTHER EXPRESS & IMPLIED WARRANTIES (WHETHER WRITTEN, ORAL, STATUTORY OR OTHERWISE), INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. CUSTOMER'S SOLE AND EXCLUSIVE REMEDY AND CANTATA SWITCHING'S SOLE OBLIGATION HEREUNDER, SHALL BE TO REPAIR, REPLACE, CREDIT OR REFUND AS SET FORTH ABOVE.

G IN NO EVENT SHALL CANTATA, ITS DIRECTORS, OFFICERS, EMPLOYEES, AGENTS OR AFFILIATES, BE LIABLE FOR ANY COSTS OR DAMAGES ARISING DIRECTLY OR INDIRECTLY FROM YOUR USE OF ANY PRODUCT INCLUDING ANY INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, MULTIPLE, PUNITIVE OR CONSEQUENTIAL DAMAGES, INCLUDING LOST PROFITS, WHETHER BASED ON CONTRACT, TORT (INCLUDING NEGLIGENCE), STRICT LIABILITY OR OTHER LEGAL THEORY, EVEN IF CANTATA, OR ANY OF ITS DIRECTORS, OFFICERS, EMPLOYEES, AGENTS OR AFFILIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY EVENT, CANTATA'S CUMULATIVE LIABILITY TO YOU FOR ANY AND ALL CLAIMS RELATING TO THE USE OF ANY PRODUCT SHALL NOT EXCEED THE TOTAL AMOUNT OF THE PURCHASE PRICE OR LICENSE FEES PAID TO CANTATA FOR SUCH PRODUCT.

H. CUSTOMER AND CANTATA HEREBY WAIVE THEIR RIGHT TO TRIAL BY JURY TO THE FULLEST EXTENT PERMITTED BY LAW IN CONNECTION WITH ALL CLAIMS ARISING OUT OF OR RELATED TO THIS WARRANTY, THE PRODUCTS COVERED HEREBY OR THE PERFORMANCE OF ANY PARTY HEREUNDER.

I. THIS WARRANTY SHALL BE CONSTRUED UNDER AND GOVERNED BY THE LAWS OF THE COMMONWEALTH OF MASSACHUSETTS WITHOUT GIVING EFFECT TO ANY CHOICE OR CONFLICT OF LAW PROVISION OR RULE (WHETHER OF THE COMMONWEALTH OF MASSACHUSETTS OR ANY OTHER JURISDICTION) THAT WOULD CAUSE THE APPLICATION OF THE LAWS OF ANY JURISDICTION OTHER THAN THE COMMONWEALTH OF MASSACHUSETTS. CUSTOMER SPECIFICALLY AND IRREVOCABLY CONSENTS TO THE PERSONAL AND SUBJECT MATTER JURISDICTION AND VENUE OF THE FEDERAL AND STATE COURTS OF THE COMMONWEALTH OF MASSACHUSETTS AND SUCH COURTS SHALL HAVE EXCLUSIVE JURISDICTION WITH RESPECT TO ALL MATTERS CONCERNING THIS WARRANTY OR THE ENFORCEMENT OF ANY OF THE FOREGOING.

J. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS. YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM JURISDICTION TO JURISDICTION.

1 EXS & SwitchKit API Messages

Overview

Purpose This chapter provides an introduction to API messages and then lists the EXS Application Programming Interface (APIs) messages created by Cantata. The messages are listed alphabetically. Within the messages are hyperlinks to messages modules (AIBs, ICBs, and TLVs) that are carried by the messages.

Introduction to API Messages

Overview Messages and Responses

Messages and Responses each contain a header and a checksum, and can also contain AIBs (Address Information Blocks), ICBs (Information Control Blocks), TLVs (Tag-Length-Value blocks), and data.

Data

Data can reside in its own Data field or within AIBs, ICBs, or TLVs.

Field

A Field corresponds to a single row in the main Message/Response table, and it can be either one byte (for example 0x1B) or two bytes long (for example 0x1B4D). In accordance with Big Endian formatting, when a field is two bytes long, the first byte (in this case 0x1B) is the Most Significant Byte (MSB) and the second byte (in this case 0x4D) is the Least Significant Byte (LSB).

The next figure, *EXS API Message / Response Table*, provides an overview of API messages and refers to the chapters containing the specific information.

Figure 1-1 EXS API Message / Response Table

Messages and Responses each contain a header, checksum, and AIB (Address Information Block). Messages and Responses can also contain ICBs (Information Control Blocks), TLVs, (Tag-Length-Value blocks) and data. Data can reside in its own Data field or within ICBs or TLVs. A Field corresponds to a single row in the main Message/Response table, and it can be either one byte (for example 0x1B) or two bytes long (for example 0x1B4D). In accordance with Big Endian formatting, when a field is two bytes long, the first byte (in this case 0x1B) is the Most Significant Byte (MSB) and the second byte (in this case 0x4D) is the Least Significant Byte (LSB).

A **Message** is sent from the host computer to the EXS CSP, or vice versa.

A **Response** is sent from the EXS CSP in reply to a Message from the host computer, or vice versa. If the Response comes from the EXS CSP, the AIBs, ICBs, TLVs, and Data field values might match those that were sent in the corresponding Message.

Message (white)	Response (gray)
Header	Header
AIB An AIB contains one or more AEs. AIBs are listed in the API message and are fully defined in the AIBs chapter. AE AE (possible)	AIB AE AE (possible)
ICB There are three types of ICB: Action (0x01) Data (0x02) and Extended Data (0x03). An ICB can contain TLVs, and ISDN ICBs can contain IEs. ICBs are listed in the API messages and are fully defined in the ICBs chapter. TLV (possible)	ICB TLV (possible)
TLV A TLV can stand on its own in a message or it can be embedded in an ICB. A TLV can also contain one or more levels of nested TLVs. In this case, the TLV Count applies to only the "outermost" (highest level) TLVs, and not to the nested TLVs. TLVs are listed in the API messages and are fully defined in the TLVs chapter. Nested TLV (possible)	TLV Nested TLV (possible)
	Status Unlike a Message, a Response can have a Status field, but only if the Response comes from the EXS CSP. A Response from the host computer has no Status field. A value that appears in the Status field is named a Response Status Value (RSV). If an RSV is used by more than one message, it is defined in the Common Response Status Values chapter. An RSV that is unique to a specific Response is defined on the Response side of the Message/Response table itself.
Checksum	Checksum

Generic API Message Format

API messages and responses are frames, containing strings of paired characters. The characters are represented in hexadecimal notation. Each frame consists of a standard header, followed by a variable number of data bytes. The data is unique to each message.

All messages, whether initiated by the CSP or by the host, must have a corresponding Response. The message fields are shown on the left (white) side of the table and the response fields are shown on the right (gray) side.

In this example, standard header information (bytes 0–) is indicated by the bold outline.

Field Descriptions

This section describes the fields in the header of each API message and response.

Frame

The first field in every message is always the *Frame* field. It is a one-byte value that indicates the beginning of the frame. The value **0xFE** is reserved for this purpose alone.

Because the value 0xFE is reserved for the *Frame* field, you must never use this value in any other field. If you must send the value 0xFE within the contents of a message, you must encode it using an escape sequence.

Length

The second field is always the *Length* field. It is a value that indicates the number of bytes to follow, excluding the *Checksum*.

Important! The system calculates the message length before using an escape sequence. You must do the same.

To calculate the value of the *Length* field, count the bytes between, but not including, the *Length* field and the *Checksum* field. In the message below, the length is 5. You can see the value 5 in the second byte of the length field, represented in hexadecimal notation as **0x05**.

MESSAGE	
Byte	Field Description
0	Frame Character (0xFE)
1	Length, MSB (0x00)
2	Length, LSB (0x05)
3	Message Type, MSB

MESSAGE	
Byte	Field Description
4	Message Type, LSB
5	Reserved (0x00)
6	Sequence Number
7	Node ID
8	Checksum

Message Type

The third field is always the *Message Type* field. It is a value that identifies the format and particular information contained in the message or response.

Sequence Number

Use the Sequence Number field(s), Bytes 5 and 6, to match corresponding responses and messages. Because the EXS API protocol is asynchronous, the system may contain more than one outstanding message of the same type. When a response to one of these messages returns, the response would be useless if there were no way to trace it to its corresponding message.

The Sequence Number resolves this issue by initiating either an 8-bit or 16-bit sequence number in an EXS API message. The sender of the message (either the host or the CSP) assigns the sequence number.

To provide backward compatibility, the 16-bit sequence number is enabled using the Generic Card Configure 0x0122 message and can be queried using the Generic Card Query 0x0123 message. The Matrix/Host Sequence Number Size TLV (0x0640) is used to configure either the 8-bit or 16-bit sequence number.

- 8-Bit Sequence Number

An 8-bit sequence number in the Byte 6 field is the default configuration. In this configuration, the Byte 5 field should always be set to 0x00 in CSP and Host initiated messages. Any other value in this field is reset to 0x00 in the response message to the Host. An 8-bit sequence number is in the range of 0x00-0xFF.

- 16-bit Sequence Number

A 16-bit sequence number extends the 8-bit sequence number Byte 6 (LSB) field into the Byte 5 (MSB) field to create a 16-bit sequence number. A 16-bit sequence number will be in the range of 0x00-0xFFFF.

When the Matrix Controller card is configured to use the 16-bit sequence number, Bytes 5 and 6 will contain the sequence number for both Host and CSP-initiated messages.

- A 16-bit sequence number in a Host-initiated message will follow the message through the CSP and be returned in the response.
- A 16-bit sequence number in a CSP-initiated message will be passed to the Host and be expected in the Host response.

Important! The 16-bit Sequence Number does not support LAPD and EXNET Connect.

AIB

Address Information Blocks (AIBs) are used to address system objects such as slots, spans, and channels. An AIB can contain one or more Address Elements (AEs) to accommodate a variety of addressing requirements. An Address Element is a group of data bytes that represent specific address information.

Status

Most responses contain a *Status* field that follows the header. If the CSP processes a message successfully, it returns a positive acknowledgment (ACK) value of 0x10 in this field.

If an error occurs while the CSP is processing the message, the CSP returns a negative acknowledgment (NACK) value that indicates the reason for the error. Negative acknowledgements identify problems such as call processing anomalies and configuration errors. A negative acknowledgment value can be anything other than 0x10, which is reserved for positive acknowledgements.

Data

The contents of the data bytes vary for every message and response. Please refer to individual messages for data definitions.

Checksum

The value of the *Checksum* field is the sum of the values of all header and data bytes, except for the *Frame* field. The system calculates the checksum before it uses an escape sequence, if an escape sequence is required.

Message Format Documentation Conventions

This section describes the conventions used in this publication for the following:

- Byte Numbering
- Variable Number of Fields
- Word-sized Fields
- Bit Masks
- Double-Line in Table

Byte Numbering

In this Reference, the actual number of bytes in a message field is shown only if the value never changes. For example, the number of bytes in the header field is shown because the header bytes will always be 0-.

Variable Number of Fields

The number of bytes in a series often changes (for example, with variable data) so it cannot be shown in this Reference. In these cases, the first field is defined in the Reference, but subsequent fields are represented by vertical dots, as shown in below.

12	Data
:	:

Word-size Fields

API messages frequently use multiple byte fields for the following:

- Timers
- Conference IDs
- PPL Event IDs
- PPL Component IDs

Fields that are more than one byte long use the Big Endian format of Most Significant Byte (MSB) first, Least Significant Byte (LSB) last.

For example, as shown in below, Byte 8 is the MSB and Byte 9 is the LSB for the *Conference ID* field.

Byte 8	Conference ID, MSB
Byte 9	Conference ID, LSB

If the Conference ID is 05, you would enter the ID as shown in the next figure. Note that the first value (MSB) is 0x00 until the value of the LSB field “overflows” (is greater than 255). These two-byte fields are often represented as a combined Hexadecimal number. For example, in the figure below, the combined representation of 0x00 and 0x05 would be **0x0005**.

Figure 1-2 Conference ID

Bit Mask

A bit mask is a byte that uses its individual bits to enable or disable functions. Setting the bit enables the function. This process is shown in the following example, taken from the *Alarm* message:

Example:

Data[1]Span Status

This is a bit mask indicating the information that is sent and received on the span. You can set multiple bits.

Bit

0 Receiving Red

1 Receiving Remote Alarm Indication/Yellow

2 Receiving Loss of Signal

3 Receiving Out of Frame

4 Sending Red (AIS)

5 Sending Remote Alarm Indication/Yellow

6 Receiving AIS

7 Receiving constant E-bit with Remote Alarm Indication. This bit is valid for E1 with insert CRC and Euro-ISDN.

When you print a message trace, you read a two-byte bit mask from right to left, as shown below (0 to 15).

15	. . .	8	7	. . .	0

Double Line in Table

A double line in a table indicates that you do not repeat the fields above it. In the example below, the double line between String 1 and String 2 indicates that you can have multiple strings in the ICB but that you do not repeat the information above the field, "String 2: BCD Digit Count."

ICB Type	0x02 (Data)
ICB ID	0x01
Data Length	Variable
Data[0]	Stage Number (1–4)
Data[1]	0x01 (Host-Supplied Digits)
Data[2]	Outputpulsing Signal Type 0x01 DTMF 0x02 MFR1 (host does not include KP or ST) 0x03 MFR2 0x04 MFR1 (host includes KP and any ST signal) 0x05 Dial Pulse
Data[3]	String Count (1 or 2)
Data[4]	String 1: BCD Digit Count
Data[5]	String 1: 1st BCD Digit Pair
:	:
:	String 1: Last BCD Digit Pair
:	String 2: BCD Digit Count
:	String 2: 1st BCD Digit Pair
:	:
:	String 2: Last BCD Digit Pair

Escape Sequences

The CSP uses the value 0xFE in the *Frame* field to indicate the beginning of a new frame. If a field value within a message or response is 0xFE, the CSP erroneously tries to process the next piece of data as a new message or response.

An escape sequence resolves this issue. Use the value 0xFD plus an extra byte that immediately follows it to send the values 0xFE or 0xFD. The table below shows the values that the system recognizes.

Value To Be Sent	Escape Sequence Values
0xFD	0xFD 0x02
0xFE	0xFD 0x01

When the CSP reads the value 0xFD within a frame, it uses the following byte to one-complement the 0xFD value. The sum of the complement byte and 0xFD produces the actual value sent.

Important! You cannot use the values 0xFE or 0xFD immediately following the initial 0xFD value.

When you calculate the length of a message that uses an escape sequence, do not include the extra byte that you added to the message. The length of a message is defined *before* the escape sequence is used.

For example, if you are sending the *Version Request* message and it includes the value 0xFE: The value of the *Length* field is the number of bytes between the *Length* and *Checksum* fields. The original length of this message is 0x. When you use the escape sequence, you add another byte to the message.

Although you added another byte to the message, you do not change the value of the *Length* field.

Frame	Length, MSB	Length, LSB	Message Type, MSB	Message Type, LSB	Reserved	Sequence Number	X	Logical Node ID	Checksum
FE	00	05	00	02	00	FD	01	01	05

Basic Message Set

The primary function of the basic message set is to download the CSP Software from the host, and to query the CSP. When the CSP Software is completely downloaded, the CSP stops running from the Matrix Controller Series 3 card firmware, and starts running from the Matrix Controller RAM load. You can think of the Basic Message Set as a core group of messages.

The following messages comprise the basic message set:

- *Alarm*
- *Alarm Cleared*
- *Become Active*

- *Card Status Query*
- *Clear System Software*
- *Download Begin BRecord*
- *Download Begin SRecord*
- *Download BRecord*
- *Download Complete*
- *Download SRecord*
- *Fault Log Query*

API Messages Sent to the Standby Matrix Controller

The host can send the following API messages to the standby matrix card.

- *Card Status Query* (0x0083)
- *Clear System Software* (0x000C)
- *Download Begin BRecord* (0x009B)
- *Download Begin SRecord* (0x00A2)
- *Download BRecord* (0x009B)
- *Download Complete* (0x00A4)
- *Download SRecord* (0x00A3)
- *Fault Log Query* (0x0086)
- *Poll* (0x00AB) ACK
- *Poll Interval Configure* (0x009F)
- *Poll Request* (0x009E)
- *Reset Matrix* (0x009D)
- *Version Request* (0x0002)

AddLLCCard

Type SwitchKit API message

Overview Use the *SK_AddLLCCard* message as an external application connected to the LLC. This message opens sockets to the SS7 cards on the node and sets up routing to the SS7 card.

AddLLCCard is used to create and connect pairs of card level device to the LLC. It has the ability to accommodate various card types including SS7 TCAP. Additional routing ID's can be added to the same connection by sending multiple *AddLLCCard* messages to the same IP pair and specifying a different Routing ID. By setting the action field to 0x01 (Remove Connection), it is assumed that all routing IDs on this connection will no longer be used and will therefore be removed by the LLC. For an application to maintain communication to the card, there must always be at least one routing ID configured for that IP pair.

This message cannot be used in a SwitchManager configuration file. Instead use the Add SS7TCAPCard message. SwitchManager will generate the appropriate *AddLLCCard* messages for you.

Sent by Application

C Structure

```
typedef struct {
    BaseFields Base;
    char CardIP1[30];
    char CardIP2[30];
    int RoutingID;
    int ControlNode;
    unsigned short CardType;
    UBYTE Action;
    UBYTE reserved88[5];
} SK_AddLLCCard;
```

C Structure Response

```
typedef struct {
    BaseFields Base;
    int Status;
    int RoutingID;
    UBYTE Reserved1;
    UBYTE reserved26[5];
} SK_AddLLCCardAck;
```

C++ Class `class SKC_AddLLCCard : public SKC_ToolkitMessage {`
 `public:`

AddLLCCardAck

The LLC will acknowledge AddLLCCard messages with an AddLLCCardAck message.

```
AddLLCCardAck(Status=<*Response Value>,  
RoutingID=      < Unique ID for Card Pair Added>,  
Reserved1=      <Not currently used>);
```

Status field Possible Response Values found in the status field of an AddLLCCardAck message.

*Response Values	Action
SK_SUCCESS	SubComponent connection was successfully added to the LLC.
SK_CONNECT_IN_USE	The RoutingID specified is currently in use.
SK_DUP_IP_ADDR	One of the IP's is being used by another pair of Devices.
SK_INTERNAL_LIMIT_REACHED	The max number of subComponents has been exceeded.
SK_INTERNAL_MEM_ERROR	There was a problem allocating memory within the LLC.
SK_NODE_DOESNT_EXIST	The node id specified has not been added to the LLC via an AddLLCNode message.
SK_BAD_IP_ADDRESS	An invalid IP string was encountered
SK_NO_MESSAGE	Invalid message parameter found while processing request.

RoutingID Macros

To avoid duplicate values, the routing ID for each type of sub-component card must be derived using that cards corresponding get_RoutingID macro. Macros will be defined within SK_API.h so that they are globally accessible.

Macros available for deriving RoutingID's.

CardType	Function
SK_SS7TCAP_BOARD (0x03)	getSS7TCAP_RoutingID(int stackid(0-255));

AddLLCNode

Type EXS SwitchKit API message

For the same functionality, the EXS API message is Assign Node ID (0x0010).

Purpose Use *SK_AddLLCNode* at the initial configuration of your system and to dynamically add a node while Low-Level Communicator is running.

Important! To assign a logical node ID within a CSP system, the ring must be out-of-service (OOS). Assuming the ring is OOS and the nodes already assigned, if you try to re-assign a logical node ID, the *AssignNode* messages issued on behalf of the *AddLLCNode* message will be NACKed by that node. You must have unique logical node IDs at all times within a CSP system. For example, if you have two nodes (nodes 2 and 3) and you want to re-assign logical node ID 2 to node 3 and logical node ID 3 to node 2 the *AssignNode* messages will be NACKED by the CSP and the *AddLLCNode* will ultimately fail. You will have to de-assign logical node IDs 2 and 3 first by sending a *ResetConfig* message to each of the nodes. Only then can you freely assign node IDs using the *AddLLCNode* message.

Description The *AddLLCNode* message informs the LLC of a CSP Node. It specifies the Node ID and the matrix controller IP addresses for each node. This can be used to add, update, or delete a node. The node must already have software downloaded through TFTP. Sending *SK_AddLLCNode* for a node that needs software will fail.

CAUTION

*Do not use the shared IP address that can be used for SIP and H.323 redundancy. See [Configuring a Shared IP Address Using BOOTP Server in the API Developer's Guide: Overview](#). Use the fixed IP addresses for the matrix cards in the *AddLLCNode()* message. If you don't, the LLC will inaccurately reflect the state of the CSP.*

Important! When LLC receives a request to connect to a node using *AddLLCNode()*, LLC will maintain that connection until a disconnect message is received. If the specified IP address is not

reachable, LLC will continue attempting the connection indefinitely. This condition will be logged in the LLC maintenance log file.

When the Switch Manager reconnects to the LLC, *AddLLCNode* messages are sent from the Switch Manager to the LLC. This causes the LLC to open a socket (connection) to the CSP and the *AssignNode* message (which is the switch-level equivalent of *AddLLCNode*) is sent to the CSP.

Sent by SwitchManager

Add a Node To add a node, you must send a configuration file with SwitchManager. The configuration file should contain at least the following information:

```
AddLLCNode (matrix1="10.10.55.10", matrix2="10.10.55.11",
             RequestedNode=0x08);
```

If you are adding a node with a single Matrix Controller and you use the Matrix2 argument in your message, be sure to enter the 0-length string as its value. The configuration file should contain at least the following information:

```
AddLLCNode (matrix1="10.10.55.10", matrix2="",
             RequestedNode=0x08);
```

Arguments The following table shows the arguments you can change:

Argument	Description
Action	Specifies whether a node gets added, updated, or deleted. The values are: SK_ADD_NODE = 0 (default) SK_DELETE_NODE = 1 SK_UPDATE_NODE = 2
CallControlNode	Reserved
Matrix1	A text field corresponding to the IP address of the primary Matrix Controller.
Matrix2	A text field corresponding to the IP address of the secondary Matrix Controller, if it exists. If there is only one Matrix Controller in the node, this field must be set to "", that is, the 0-length string.

Argument	Description
NodeType	- Needs to be specified for ISDN and H.323 device server nodes. NodeType = <i>SK_LSS_DS_SYSTEM</i> or 16. - Needs to be specified for EXNET Connect nodes: NodeType = <i>SK_EXNET_SYSTEM</i> or 300. - If the above values are not used, the NodeType will default to SK_CS_SYSTEM or 200.
PhysicalNode	Reserved
RequestedNode	RequestedNode is the logical node ID requested to be assigned to the new node. The API will attempt to assign this node: - If there is no node ID currently on the node; - If it is currently assigned a different node ID. It is not a guarantee that this node will be assigned. In particular, the node ID might already be in use on the ring. If so, AddLLCNode will fail, no connection will be established with the node. If the LLC is already connected to a node with the specified logical node ID, the AddLLCNode is considered an update, if treated accordingly.
SeqNumWidth	Determines whether a message will have two-byte sequence numbers or one-byte sequence numbers. A one-byte SeqNumWidth is 0xff A two-byte SeqNumWidth is 0xffff
ISUPRemCon	Specifies whether SS7 cards can act as though they are on a ring, even if they are not. The values are: If set to 0, a multi-node system must have an EXNET (ring) card. If set to 1, forces the system to act as if it is a multi-node system even when there is no EXNET (ring) card in the CSP.

Configuration

```
AddLLCNode (
    Node = integer,
    ConnectionID = integer,
    Matrix1 = string,
    Matrix2 = string,
    RequestedNode = integer,
```

```
Action = integer);
```

```
C Structure typedef struct {  
    char Matrix1[30];  
    char Matrix2[30];  
    int RequestedNode;  
    int PhysicalNode;  
    unsigned short NodeType;  
    unsigned short CallControlNode;  
    UBYTE Action;  
    unsigned short SeqNumWidth;  
    UBYTE ISUPRemCon;;  
    } SK_AddLLCNode;
```

C Structure Response

```
typedef struct {
    int Status;
    int ActualNode;
    UBYTE DownloadStatus;
} SK_AddLLCNodeAck;
```

C++ Class

```
class SKC_AddLLCNode : public SKC_ToolkitMessage {
public:
    const char *getMatrix1() const;
    void setMatrix1(const char *x);
    const char *getMatrix2() const;
    void setMatrix2(const char *x);
    int getRequestedNode() const;
    void setRequestedNode(int x);
    int getPhysicalNode() const;
    void setPhysicalNode(int x);
    unsigned short getNodeType() const;
    void setNodeType(unsigned short x);
    unsigned short getCallControlNode() const;
    void setCallControlNode(unsigned short x);
    UBYTE getAction() const;
    void setAction(UBYTE x);
    unsigned short getSeqNumWidth() const;
    void setSeqNumWidth(unsigned short x);
    UBYTE getISUPRemCon() const;
    void setISUPRemCon(UBYTE x);
};
```

C++ Class Response

```
class SKC_AddLLCNodeAck : public SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
    int getActualNode() const;
    void setActualNode(int x);
    UBYTE getDownloadStatus() const;
    void setDownloadStatus(UBYTE x);
};
```

AddSS7TCAPCard

Type EXS SwitchKit API message

Overview The *AddSS7TCAPCard* message is used to make a direct TCP connection between the LLC Host and a SS7 card for the purpose of routing TCAP traffic on a separate link. This message creates the appropriate AddLLCCard messages and sends them to the LLC.

Sent by Host, using Converged Services Administrator (CSA), webCSA or SwitchManager configuration file.

Arguments The following table shows the arguments that you can modify:

Argument	Description
CardIP1	The primary SS7 card IP address in the CSP.
CardIP2	The standby SS7 card IP address, if it exists. If there is only one SS7 card in the node, this field should be set to "", that is, the 0-length string.
StackID	The ID of the TCAP stack to which the LLC connects.
SSN	The Subsystem Number configured on the SS7 card to which the LLC should connect.
ControlNode	The logical node ID assigned to the Matrix Controller which controls the chassis where the SS7 card resides.
Action	0x00 To add a connection 0x01 To remove a connection and all RoutingIDs

C Structure

```
typedef struct {
    char CardIP1[30];
    char CardIP2[30];
    UBYTE StackID;
    UBYTE SSN;
    int ControlNode;
    UBYTE Action;
    UBYTE reserved84[5];
} SK_AddSS7TCAPCard;
```

C++ Class `class SKC_AddSS7TCAPCard : public SKC_DummyMessage {`

```
public:
    const char *getCardIP1() const;
    void setCardIP1(const char *x);
    const char *getCardIP2() const;
    void setCardIP2(const char *x);
    UBYTE getStackID() const;
    void setStackID(UBYTE x);
    UBYTE getSSN() const;
    void setSSN(UBYTE x);
    int getControlNode() const;
    void setControlNode(int x);
    UBYTE getAction() const;
    void setAction(UBYTE x);
```

AdjustMessageTimeout

Type	EXS SwitchKit API message
Purpose	Use the <i>SK_AdjustMessageTimeout</i> message to change the default time-out for responses.
Description	SwitchKit allows all requests to the CSP a fixed amount of time to complete before the request is considered timed out. For most messages, this time is 15 seconds which is often acceptable for these SwitchKit-defined time-outs. However, there are times when the time-out specified is insufficient. In particular, when several time consuming messages are sent to the same node simultaneously, the time to complete a request can increase due to latency within the CSP. These increased delays occur primarily during configuration time. The <i>AdjustMessageTimeout</i> message increases the time-out for all messages by <i>TimeoutIncr</i>. In other words, if an application requested that the time-out be adjusted by 10 seconds, the time-out on most messages sent by that application would become 25 seconds. Messages that have a larger default time-out would have their time-out increased by the same 10 seconds. You must set the <i>Action</i> field for <i>SK_AMT_ACTIVATE_TIMEOUT</i>, to activate a new time-out. To set this new time-out for all applications connected to the LLC, set the <i>NumApps</i> field to <i>SK_ALL_APPS</i>. If you attempt to set a new time-out for only one application, don't set the <i>NumApps</i> field. You can reset the time-out by setting the <i>Action</i> field to <i>SK_AMT_DEACTIVATE_TIMEOUT</i>.
Sent by	Application
Arguments	The following table shows the user modifiable arguments of the <i>AdjustMessageTimeout</i> message:

Argument	Description
Action	Action specifies whether a new timeout gets activated or deactivated.
TimeoutIncr	TimeoutIncr specifies the amount of time added to the prior timeout value.
NumApps	NumApps specifies whether the new timeout gets set for only one or all messages.

Configuration *AdjustMessageTimeout* (
 Node = integer,
 ConnectionID = integer,
 Action = integer,
 TimeoutIncr = integer,
 NumApps = integer);

C Structure typedef struct {
 UBYTE Action;
 unsigned short TimeoutIncr;
 UBYTE NumApps;
 } *SK_AdjustMessageTimeout*;

C Structure Response typedef struct {
 int Status;
 } *SK_AdjustMessageTimeoutAck*;

C++ Class class *SKC_AdjustMessageTimeout* : public
 SKC_ToolkitMessage {
 public:
 UBYTE getAction() const;
 void setAction(UBYTE x);
 unsigned short getTimeoutIncr() const;
 void setTimeoutIncr(unsigned short x);
 UBYTE getNumApps() const;
 void setNumApps(UBYTE x);
 };

C++ Class Response class *SKC_AdjustMessageTimeoutAck* : public SKC_ToolkitAck
 {
 public:
 int getStatus() const;
 void setStatus(int x);
 };

Alarm 0x00B9

SwitchKit Name Alarm

Type EXS API and SwitchKit API message

Description The CSP sends this message to indicate that an alarm condition has been detected. The following information is reported:

- Severity
- Alarm Type
- Alarm Number
- Alarm Data

Alarm Cleared

In some cases, the CSP sends an *Alarm Cleared* message after the alarm condition ceases. The alarms that are followed by an *Alarm Cleared* message are marked with an asterisk (*).

Related Messages Alarm Cleared (AlarmCleared) 0x00C1

Sent by CSP

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE InfoSize;
    UBYTE Severity;
    UBYTE Entity;
    UBYTE AlarmNum;
    UBYTE Info[249];
} XL_Alarm;
```

C++ Class

```
class XL_Alarm : public XLC_InboundMessage {
public:
    UBYTE getInfoSize() const;

Alarm Type The table below contains a summary of the alarms showing the range of alarm numbers for each type and the length.

Alarm Information See the table for each alarm type below for the following information:

- Alarm Severity
- Alarm Number/Alarm
- Data Length
- Data

Summary of Alarms

Alarm Type	Alarm Number Value or Range	Data Length
0x01 General	0x01-0x1F, 0x21-0x22	Variable
0x02 Card	0x01-0x1C	Variable
0x03 Span	0x01-0x05	0x06

Alarm Type	Alarm Number Value or Range	Data Length
0x04 Channel	0x02	0x17
	0x03	0x12
0x05 DSP SIMM	0x01-0x06	0x06
0x06 DSP	0x01, 0x02	Variable
0x07 CSP Node	0x01-0x08, 0x0A-0x15	0x06
0x08 DS3	0x01 - 0x03	0x07
0x09 VoIP Module	0x00, 0x01, 0x02, 0x03	0x07

0x01 General Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x01*	System busy condition The CSP sends this alarm when the Matrix Controller is flooded with messages. The CSP will ignore all incoming calls until the alarm is cleared.	0x00	The system ignores incoming calls until the alarm is cleared. Ignoring incoming calls decreases the traffic load and eventually the alarm will clear. Ensure that System Busy Warning messages are no longer being seen. Slowly ramp traffic back to normal levels and resume normal operation.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major: Default Minor: If clock mode was switched to REF1 or REF2.	0x02	Clock mode switched	0x02	The system automatically switches the clock mode to the next available clock source and reports the following data to the host: Data[0] - Current Synchronization Mode Data[1] - Previous Synchronization Mode Values for Data[0] and Data[1] fields: 0x01 Primary Reference Clock Signal 0x02 Secondary Reference Clock Signal 0x03 Primary Loop Clock Signal 0x04 Secondary Loop Clock Signal 0x05 Free Running Clock Signal This notification occurs when the clock mode was automatically switched or reference clock sources have been lost. The CSP will automatically set the clock mode to the next available clock source. Either a master timing source has been disconnected or gone bad, or a span signal has been lost. Investigate why the signal has been lost and try to restore it if possible. This signal may be controlled by the network in which the Loop timing is dependent.
Inform.	0x03	Hardware cannot support DSP function		Verify the correct card type.
Major	0x04*	Reference 1 Clock Source Lost No host intervention is needed. The CSP will automatically switch the clock mode to the next available clock source.	0x00	The system automatically switches the clock mode to the next available clock source. The Reference Clock Source has been lost. No host intervention is needed for this occurrence. The CSP will automatically switch the clock mode to the next available clock source. Have Operational Personnel Check to see what happened to the External Timing Source Connected the CSP Matrix I/O.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x05*	Reference 2 Clock Source Lost No host intervention is needed. The CSP will automatically switch the clock mode to the next available clock source.	0x00	The system automatically switches the clock mode to the next available clock source. The Reference Clock Source has been lost. No host intervention is needed for this occurrence. The CSP will automatically switch the clock mode to the next available clock source. Have Operational Personnel Check to see what happened to the External Timing Source Connected the CSP Matrix I/O.
Major	0x06	DSP Resource Blocked	0x01	Data[0] DSP Function Type
Major	0x06	DSP Resource Blocked	0x04	Data[0] Slot where VRA Block occurred Data[1] Chain across SIMMs Data[2-3] RAN ID blocked The CSP will send this alarm when all the resources of the particular resource type are all in use. The request to use a specific resource is placed in a queue until there is a resource of the alarmed type freed. The request is placed in a queue waiting for a resource to free unless a <i>DSP Service Cancel</i> (0x00BE) message is send by the host or the channel that the resource was requested on is release. See the DSP SIMM Configure (0x00C0) message in the API Reference and the <i>CSP Developer's Guide: Overview</i> for details on DSP function types. Either wait for the resource requested to free up which is the most likely response. Send a <i>DSP Service Cancel</i> (0x00BE) message message. Release the channel that the resource was requested on. If you find that the CSP is reporting a large number of these alarm it maybe a good idea to re-evaluate the number of resouces per function type you have configure. You may need to increase the number of configured functions type.

Alarm 0x00B9

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x07	DSP Resource Function Type Not Configured	0x02	Data[0] Resource Type Data[1] Resource Type 2 (0x00 if no second resource type) The DSP function type requested is not configured and will need to be configure in order to use the resource being requested. See the DSP SIMM Configure (0x00C0) message in the API Reference and the <i>CSP Developer's Guide: Overview</i> for details on DSP function types. Configure the DSP function type for the resource being requested.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x08	DSP Resource Management Inconsistent. (An internal task has asked to attach the same type of DSP resource to a single timeslot twice. This Alarm is sent when: - A receiver has been requested but a Call Progress or Digit receiver for the same layer is already attached to the timeslot - A transmitter has been requested but a Digit or Recorded Announcement transmitter for the same layer is already attached to the timeslot	0x04	Data[0, 1] Internal Timeslot (Cantata use only) Data[2] Process Virtual Identifier (The process that requested the DSP service. For example, Call Control, Layer 4, or E1 PPL) (Cantata use only) 06 - L4 PPL call processing 11 - Logical ID for all Layer 3's 1A - Layer 3 Plus 24 - SS7 25 - SS7 MTP2 28 - E1 Protocol Layer PPL 29 - T1 Protocol Layer PPL Data[3] Resource Type (The DSP Resource requested. For example, DTMF Digit Transmitter). 00 - Outpulse CP 01 - Outpulse digits 02 - Collect CP 03 - Collect digits 04 - Conference 05 - Outpulse Announcement 06 - Detect energy 07 - Broadcast 08 - Collect FSK 09 - Outpulse FSK 0A - Detect coin 0B - Play file 0C - Record file 0D - Modify play 0E - Fax XMT 0F - Fax RCV 10 - Modify record 11 - Echo cancel XMT 12 - Echo cancel RCV 13 - PVD/AMD RCV An internal task has asked to attach the same type of DSP resource to a single timeslot twice. Free the resource that is attached to the timeslot. Send down a <i>DSP Service Cancel</i> (0x00BE) message to release the channel and start a new call.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x09	Download Record Timeout	0x00	Restart the download. This alarm only concerns legacy download procedures. The Series 3 Matrix card supports only Full TFTP. The host must follow each download message with another download message or a Download Complete message within five minutes, or the download aborts. For example, when a Download Begin BRecord is sent, a Download BRecord must follow within five minutes. The Download BRecord must be followed by either another Download BRecord or Download Complete within five minutes. Check ethernet connectivity or the application's download module for delays. Restart the download. If problem persists contact Cantata Technical Support. Please be advised that an Ethernet capture may be requested.
Major	0x09	Invalid Associated Channel	0x03	Data [0] Logical Span ID MSB Data [1] Logical Span ID LSB Data [2] Channel Verify the configuration and call flow in the socket.log file. If the problem persists, contact Cantata Technical Support
Inform.	0x0A	Partial Message Received (for example, incorrect checksum, zero length message, or message did not begin with frame character)	0x00	Partial Message Received (for example, incorrect checksum, zero length message, or message did not begin with frame character) Collect the socket.log, alarm.log, maintenance_llc_XXX.log and a list of the applications running on the system and contact Cantata Technical Support.
	0x0B	RAN Requested is Unavailable in System		Check if this announcement was reached in error.
Inform.	0x0C	Unacknowledged Message If you configured the system's message resend logic to "Resend Once and Generate <i>Alarm</i>," these data fields contain the bytes of the resent message. For more information, refer to the <i>System Configuration</i> message.	Variable	Data[0-N] The bytes of the message Check for other error messages that would indicate a network or system condition leading to this problem.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x0D	Recorded Announcement ID Inconsistency	0x04	Data[0] Slot Number Data[1] SIMM Number Data[2, 3] RAN ID Sent upon completion of download or on card Insertion. This alarm indicates that an announcement being downloaded has the same ID as an existing announcement, but with different information. When the ID is specified in the <i>Recorded Announcement Connect</i> message, either announcement could be played. Each RAN must have a unique ID. One of the announcements (usually the older one) should be deleted. A Query addressed to one RAN ID returns information for only one of the RANs that share the ID. It is not possible to determine for which RAN the information will be returned. For example, if one file sharing the ID is 20 Kb and one file is 40Kb, only one of the sizes is reported, either 20 Kb or 40 Kb, but not both.
Minor	0x0E	SS7 Signaling Network Congestion When a route to a destination is congested, MTP sends the MTP_STATUS to ISUP which in turn sends this alarm to the host.	0x06	Data[0] SS7 Stack ID Data[1-4] DPC Data[5] Congestion Level Decrease the load or create a new route to the destination. If the system has not decreased the call load and this symptom persists, check the network engineering plan to possibly create a new route to the destination.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x0F*	SS7 Remote ISUP Unavailable	0x05	Data[0] SS7 Stack ID Data[1-4] DPC SS7 Remote ISDN User Part (ISUP) unavailable. The address information represents the SS7 stack and Destination Point Code (DPC). Check the status of the Links and see if they are in service by sending the <i>SS7 Signalling Link Query</i> (0x0065) message. If they are not in service, attempt to determine why the links are Out Of Service. Make sure that they are marked in service from a host perspective using the <i>Service State Configure</i> (0x000A) message. Also check the status of the SS7 Signalling Routes using <i>SS7 Signalling Route Query</i> (0x0066). If the routes are unavailable, contact your SS7 service provider and ask why they are not in service. Also check the status of layer 1 span using <i>Span Status Query</i> (0x0084) message. This will tell you if the span is in sync, and if not how many slips and errors occurring on the physical span.
Major	0x10	Node ID Already Exists	0x00	Check configuration and/or installation for correction.
Inform.	0x11	Invalid Message Length	0x00	The application software sent a message with an invalid length field. Provide the application development team and Cantata Technical support with the socket.log and the information from the trap.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x12	System Busy Warning	0x00	This notification indicates that the traffic volume on the CSP is approaching its capacity. This message is only a warning. It does not mean a System Busy condition will definitely occur. The System Busy Warning does not have a clearing Alarm. It continues to occur every few seconds, until the CPU utilization reduces. The System Busy Warning messages can be between 2 and 20 seconds apart, depending on system load fluctuations. The EXS CSP CPU occupancy has exceeded the "System Busy Warning" threshold. This condition can happen due to traffic congestion or CSP configuration during high traffic or by having Debug printing enabled on a CSP card or cards.. When a System Busy Warning is generated, the Host should reduce the number of new calls until the System Busy Warning messages cease. Whenever possible, ramp call rates up slowly and evenly to prevent an initial System Busy. Do not re-configure the CSP and do not enable unnecessary diagnostics. For more information on this alarm, refer to the CSP Developer's Overview Guide, Chapter 4 EXS API Application Development, section System Busy Warning and System Busy Alarm.
Inform.	0x13	Resource Utilization Threshold Reached	0x01	Data[0] Free Conferencing Timeslots (0x01) This normally occurs during high traffic and high utilization of conference resources. Calculate the number of free timeslots available for EXS Conferencing using the System Resource Usage Query. Determine if free timeslots need to be made available. For complete information see CSP Conferencing Section in the <i>Configuring Multi-Node Systems of the Developer's Guide: Overview</i>.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
	0x14	Subrate Resources Unavailable		The subrate resource (channels) provided by the SRC card are no longer available as (possibly) the card has been removed. Find out what the Subrate Card Status is and take actions depending on the result. Reset or change the card. If that does not work, contact Cantata Technical Support.
Major	0x15	SS7 Remote TUP Unavailable	0x05	Data[0] SS7 Stack ID Data[1-4] DPC Bring remote Telephone User Part in service.
Major	0x16*	ISDN/SS7 Signaling Stack Congestion	0x03	Data[0] Stack ID (SS7), Board Slot Number (ISDN) Data[1] Direction: 0x00 Incoming 0x01 Outgoing Data[2] Status: 0x00 Congestion Cleared (<i>Alarm Cleared</i>) 0x01 Congestion Level 1 0x02 Congestion Level 2 0x03 Congestion Level 3 Decrease the load on the ISDN/SS7 card. Consult Cantata Technical Support. Calls will resume to normal after the congestion clears. You will receive an alarm cleared message when this occurs.
Inform.	0x17	Route Table Updated	0x01	Data[0] Table ID (1-10) The active route table has been updated. The address information represents the table ID of the route table. Verify the route table is changed correctly.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x18	Resource Group Table Updated	0x01	Data[0] Table ID (1-10) ----- The active resource group table has been updated. The address information represents the table ID of the route table. Verify the resource group table is changed correctly.
Inform.	0x19	Old Route Table Deleted	0x01	Data[0] Table ID (1-10) ----- A previously active routing table has been deleted. The address information represents the table ID. Verify that the table being deleted is no longer needed.
Inform.	0x1A	Old Resource Group Table Deleted	0x01	Data[0] Table ID (1-10) ----- A resource group table has been deleted. Verify the table being deleted is no longer needed.
Inform.	0x1B	Route Table Forcefully Deleted	0x01	Data[0] Table ID (1-10) ----- The active route table was forcefully deleted. The address information represents the table ID. Verify the table being deleted is no longer needed.
Inform.	0x1C	Resource Group Table Forcefully Deleted	0x01	Data[0] Table ID (1-10) ----- The active resource group table has been forcefully deleted. The address information represents the table ID. Verify the table being deleted is no longer needed.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major or Minor (see Data)	0x1D	Flash Copy or Load Problem	0x02	Data[0] Severity 0x00 Major 0x01 Major 0x02 Major 0x03 Major 0x04 Minor 0x05 Minor 0x06 Major Data(1) Entity Valid entries for this field based on the Entity field value 0x00 are as follows: 0x00 Flash erase failed 0x01 Flash write failed 0x02 RAM load to copy is bad 0x03 Flash load bad after copy from RAM 0x04 RAM and flash have different timestamps 0x05 RAM load bad after a soft reset 0x06 RAM load bad after copy from Flash There is a problem during the flash or RAM loading. Contact Cantata Technical Support.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x1E	TFTP Alarm	Variable	Typically the following events result in this alarm. 1. Filename/path that is returned in BOOTP Response does not match. 2. TFTP Server is not reachable or running. 3. TFTP Configuration File indicates a load that is not resident or incorrectly named on the TFTP Server. 4. The TFTP file has been altered from previous version. There are four things to validate: 1. Verify that TFTP is running on the machine with the software files. 2. Verify that the TFTP Server is a reachable ethernet address from the CSP. 3. Verify that the BOOTP response indicates the correct name and path of the tftp configuration file. 4. Verify that the tftp configuration for the all .bin files specified in the tftp configuration exist on the TFTP server and contain the correct path and filenames of the software .bin files. Assume Cantata Technical support will require information on BOOTP, TFTP, and Ethernet setups. An ethernet trace may be required. Debug access to the Matrix may also be required. See 0x1E TFTP Alarm after this table.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x1F	System Memory Low		System memory has dropped below the minimum level of satisfactory performance. When the system is in this condition, it is also in a System Busy condition and the CSP sends a System Busy Alarm (0x01) to the host. Check for other error messages that would indicate a network or system condition leading to this problem. Check Ring Interface hardware and then bring the ring in service.
Major	0x20	System Memory Low Cleared		Indicates that the system returns to the minimum level of satisfactory performance. The CSP sends a System Memory Satisfactory Alarm (0x20) to the host, along with an Alarm Cleared (0xC1) message. Resume normal operation.
Major	0x21	Host Connection Dropped	0x04	Data[0] Multi-host port ID 0x3142 - 0x3147
Major	0x22	EXNET Ring Down	0x08	Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status ----- This notification is sent when an EXNET ring goes down. The address information represents the slot of the EXNET-ONE card and logical ring ID of the ring.
Inform.	0x2F	Log F/Log B Buffer is 75% Full		
Inform.	0x30	Log T Buffer is 75% Full	0x01	Data[0] Slot Number ----- Contact Cantata Technical Support.
Inform.	0x31	Log F/Log B Buffer is Full	0x01	Data[0] Slot Number ----- Contact Cantata Technical Support.
Inform.	0x32	Log T Buffer is Full	0x01	Data[0] Slot Number ----- Contact Cantata Technical Support.
	0x33	MGC Lost Connection		

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x34	DSP CPA Configuration Conflict	0x04	Data[0] Tone Group: 0x00 Data[1] Tone ID: 0x10 Data[2-3] Frequency 0x01-0xA4 Consult the <i>CSP Developers Guide: Overview</i> for details on configuring CPA. Modify the configuration.
Major	0x35	ISDN Congestion		
	0x3A	SS7 Signaling Destination Congestion Sent to the host when a particular remote node is congested as indicated by a change in the congestion level.	0x06	Data[0] Stack ID Data[1-4] DPC Data[5] ACL Level If the system has not decreased a call to this DPC and this symptom persists, check the network engineering plan to possibly create a new route to the destination.
Major	0x3B	Signaling Link Congestion When a link is congested, MTP sends MTP Status to ISUP which in turn sends this alarm to the host.	0x06	Data[0] Stack ID Data[1-4] DPC Data[5] LINK_CONGESTION_LEVEL If the system has not decreased a call to this DPC and this symptom persists, check the network engineering plan to possibly create another link in the link set.
Inform.	0x3D	NFS RAM Disk Configuration Failure	0x03	Data[0] Slot Data[1,2] Server ID Check NFS settings for the DSP2 Card.
Inform.	0x3E	NFS Server Disconnect	0x02	Data[0, 1] Server ID The connection between the DSP2 card and the NFS server has broken down. Check the Ethernet network and all Ethernet connections. If the alarms persists, update the <i>Generic Card Configuration</i> message in the CSP configuration with a NFS Poll Retries (0x601) TLV. This TLV can change the default number of polls that can be missed before this alarm is sent.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x3F	Insufficient Resource Points for DSP Function	0x01	Data[0] Function Type The system application has requested more that the allowed resource points configured on the system. Increase the number of resource points in the system with a downloadable license. Contact your sales person to purchase more licenses. You can also contact your sales engineer who can help you design your DSP2 configuration as well as estimate the number of resource points needed.
Major	0x40	DSP Request Queued Due to DSP Series 2 CPU Overload Level 2	0x01	Data[0] DSP Function Type Requested Either reduce recourse requests at the application layer or add more DSP2 cards to the system.
Inform.	0x41	Channel has an Echo Canceller resource attached but the requested receiver resource is not available on the same DSP Card.	0x05	Data[0] – Slot of DSP Card providing Echo Cancel to channel Data[1] – Function type of requested receiver Data[2, 3] – Span (MSB, LSB) Data[4] - Channel When attaching echo cancellers together with DSP receivers, be sure that the same DSP2 card is being used. The host can force the slot AIB for both message.

0x02 Card Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
	0x01	Card Taken Out of Service	Variable	0x01 Slot AIB ----- Check with operations personnel to verify card removal.
Major	0x02	Unable to Allocate Timeslots for this Card	0x05	0x01 Slot AIB ----- Verify that the CSP contains the required number of available timeslots for this card. If sufficient timeslots are available, contact Cantata Technical Support.
	0x03	Card Download is Corrupt	0x05	0x01 Slot AIB ----- Reseat the card. Try a different card. Try a different software load. If all above options fail, contact Cantata Tech Support.
Major	0x04	Card Type Not Recognized	0x05	0x01 Slot AIB ----- Check the TFTP server and the tftp configuration file to make sure the card being used is included. Contact Cantata Technical Support.
-	0x05	Reserved		
-	0x06	Reserved		
Inform.	0x07	Card's Configuration has been Reset to Defaults	0x05	0x01 Slot AIB ----- One of the following occurred: Card has been reset by the host/switchkit. Card has reset/faulted due to software error. Card has reset due to a hardware problem. If running Switchkit, Switchmgr will take care of reconfiguring the card. If not using Switchkit the host has to reconfigure the card.
-	0x08	Reserved		
Major	0x09	Card Reset	0x05	0x01 Slot AIB ----- Card has either faulted (software error) or was manually reset (either via software or via push button reset) The card should come back in service by itself.
	0x0A	Connection Map Failure	0x05	0x01 Slot AIB

Major	0x0B	Software Does Not Have Download for Card	0x05	0x01 Slot AIB ----- Software cannot be downloaded to the card. Check the TFTP server and the tftp configuration file to make sure the card being used is included. Contact Cantata Technical Support.
Major	0x0C	Card Does Not Support A-Law Encoding Format	0x05	0x01 Slot AIB ----- Card does not support A-law encoding format. Check the card type and the card configuration.
Major	0x0D	Card Revision Not Supported by System Software	0x05	0x01 Slot AIB ----- Card revision not supported by system software revision. Replace the card with a different REV card. The REV can be found on the card itself and is made of a letter and a two digit number (for example, C12). The higher letter/number the newer the REV.
Major	0x0E	Card Removed	0x05	0x01 Slot AIB ----- Check with operations personnel to verify card removal.
Major	0x0F	Hardware Failure Occurred on Slot Specified The CSP also sends a <i>Card Status Report</i> with a description of the failure	0x05	0x01 Slot AIB ----- A hardware failure has been detected on a card. Reseat the card. If that does not work, replace card.
Minor	0x10	Ethernet Host Link Error Detected NOTE: To use the Host Link Failure Detection feature and receive this message, you must have polling enabled.	0x05	0x01 Slot AIB ----- If the error continues even after the reset, the problem could be caused by slow host processing - especially during boot-up. If so, increase the polling interval.
Major	0x11	Card or Fan Tray Not Installed in Chassis	0x05	0x01 Slot AIB ----- Check if fan tray and card are installed.

Major	0x12	EXNET Port A - Communication Failure	0x08	Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status Hardware failure on EXNET Port A. The Remote Node terminating to the local EXNET Port A is not accessible (that is, the problem is not with local node but with the remote node). Verify EXNET Port A's terminating connection (remote node) is accessible. There could be a faulty fiber cabled connected to EXNET Port A. Check fiber connections are snug and connected properly. Bring the ring ot service then back in service. Reset Ring Interface card. If the lights on the Ring Interface card are still not all green, then collect the socket.log,alarm.log, and maintenance_llc_xxx.log and contact Cantata Technical Support.
Minor	0x13	EXNET Port B - Communication Failure	0x08	Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status Hardware failure on EXNET Port B The Remote Node terminating to the local EXNET Port B is not accessible (that is, the problem is not with local node but with the remote node). There could be a faulty fiber cabled connected to EXNET Port B. Check fiber connections are snug and connected properly. Verify EXNET Port B's terminating connection (remote node) is accessible. Bring the ring ot service then back in service. Reset Ring Interface card.
Minor	0x14	EXNET Port A - Fiber Laser Failure	0x05	0x01 Slot AIB Refer to the <i>Hardware Installation and Maintenance Guide</i>.

Minor	0x15	EXNET Port B - Fiber Laser Failure	0x05	0x01 Slot AIB The fiber driver on the Ring interface card has gone bad. Contact Cantata Technical Support and replace the Ring Interface Controller card.
	0x16	Subrate Card Switchover		A switchover has occurred. No action required.
Inform.	0x17	Software Error (Please report this error to Cantata Technical Support)	Variable	0x01 Slot AIB Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x01) Data[3] Data Length (0x01) Data[4] Slot Number Data[5-44] Filename (in ASCII) Data[45,46] Line Number Data[47-n] Diagnostic Data A software error occurred on a line card. The address information represents the slot containing the card. Gather all host to switch log information. Gather information as to what was occurring on the system at the time of the error and report to Cantata Technical Support.
Major	0x18	Remote SS7 card removed	0x05	0x01 Slot AIB (if SS7 card in local node) 0x69 Slot Number (if SS7 card in remote node) Check with operations personnel to verify card removal. Re-insert the working SS7 card and, Switch Manager will reconfigure this card. SwitchManager will trigger a <i>Card Status Report</i> (0x00A6) message and reconfigure the card per the configuration file that was used to start/configure the system.
Major	0x19	Bus Contention with Rear Card	0x05	0x01 Slot AIB The front card or I/O card are mismatched and incompatible with each other. Verify the I/O and card type and make sure they are supposed to be paired up.

Alarm 0x00B9

Major	0x1A	Bus Contention with Front Card	0x05	0x01 Slot AIB The front card or I/O card are mismatched and incompatible with each other. Verify the I/O and card type and make sure they are supposed to be paired up.
Major	0x1B	Internal Diagnostic Failure	0x08	Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status An internal diagnostic error has been detected on an EXNET Ring card. Test the Ring Interface Card in a different slot. If the marix continues to report this alarm to the host, replace the Ring Interface Card.
Major	0x1C	EXNET card Looped Out of Ring	0x08	Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status Test the Ring Interface Card in a different slot. If the marix continues to report this alarm to the host, replace the Ring Interface Card.
Major	0x1D	Card Added to Virtual Slot	0x05	0x01 Slot AIB The host or Switchkit has configured a virtual card. Verify card type and that the card has been placed in the correct slot. If symptoms continue, contact Cantata Technical Support for configuration guidance.

Major	0x1E	Line Card Approaching Busy/ Line Card Approaching Busy Clear	Variable	SS7 card Data[0] Slot Number Data[1-n] Reason Codes: 0x00 Low Memory 0x01 Low MCB 0x02 Low Idle CPU Data[n+1] Stack ID 16-Span SLC Data[0] Slot Number Data[1-n] Reason Codes: 0x00 Low Memory 0x01 Low MCB 0x02 Low Idle CPU Line card busy conditions exceeding the line card "Approaching Busy Threshold". Reduce the line card load by diverting traffic from the overloaded line card. Disable Debug if enabled on the line card.
Major	0x1F	Line Card Busy Line Card Busy Clear	Variable	SS7 card Data[0] Stack ID Data[1] Slot Number Data[2-n] Reason Codes: 0x00 Low Memory 0x01 Low MCB 0x02 Low Idle CPU 16-Span SLC Data[0] Slot Number Data[1-n] Reason Codes: 0x00 Low Memory 0x01 Low MCB 0x02 Low Idle CPU Caused by line card overload busy conditions. Reduce line card load by diverting traffic from the overloaded line card. Disable Debug if enabled on the line card.
	0x20	DS3 Card Limited Spans for SS7	0x05	0x01 Slot AIB Look for other error messages that indicate a network or system condition leading to this problem. If symptoms persist contact Cantata Technical Support.

	0x21	Too many DS3s Configured for Limited Spans	0x05	0x01 Slot AIB Ensure proper DS3 card DIP Switch positioning. Only one DS3 card can have DIP Switch 4 and 6 set to OFF "limited SS7 CIC traffic". The Standby DS3 card, must always have DIP switch 4 and 6 set to the ON position.
Major	0x22	Ethernet Link Failure	0x06	Data[0-4] Slot AIB (0x01) Data[5] I/O Card Ethernet Port Number This alarm is sent when an SS7 card loses its connection to a local host. This alarm is sent if a VDAC-ONE I/O or Multi-Function Media I/O card port that was previously in a steady LINK_UP state loses its connection. The VDAC-ONE slot and failed I/O port (0-2 for the 3 I/O ports on the Multi-Function Media I/O card) is sent in the data portion of the Alarm message. The alarm is cleared when the link returns to a steady Link-Up state. This alarm is sent if any I/O ports lose their network connection, and will be cleared when the connection is re-established. Trace the network cable between the I/O card and the remote Ethernet switch. Replace the Ethernet cable or the connector if necessary.
Inform.	0x39	Ethernet Link-Up	0x06	Data[0-4] Slot AIB (0x01) Data[5] Ethernet Port Number (0x00-0x02) This alarm is sent to the host the first time a link-up state is seen on the Multi-Function Media I/O card. Because there are three Ethernet ports on the Multi-Function Media I/O card, the host might see three of these alarms when the card comes into service. No action required.
Inform.	0x40	NFS Server Mounted Successfully	0x07	Data[0-4] Slot AIB (0x01) Data[5, 6] Server ID

0x03 Span Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x01	Carrier Group Alarm (CGA) or Span Dead (Please refer to the <i>Span Filter Configure</i> message)	0x07	0x0C Logical Span AIB Span Status (a bit mask that indicates what is being sent and received on the span): - Bit 0 0x01 Receiving Red - Bit 1 0x02 Receiving Remote Alarm Indication/Yellow - Bit 2 0x04 Receiving Loss of Signal - Bit 3 0x08 Receiving Out of Frame - Bit 4 0x10 Sending Red (AIS) - Bit 5 0x20 Sending Remote Alarm Indication/Yellow - Bit 6 0x40 Receiving AIS - Bit 7 0x80 Receiving constant E-bit with Remote Alarm Indication (valid for E1 with insert CRC and Euro-ISDN) This alarm is generated when the CSP detects a carrier group alarm for more than the configured time period. Either you lost a clock source or someone pulled the patch cord and broke the physical connection to the TDM (Time Division Multiplexed) network. Request operational personel find out why the physical connection has been compromised between the CSP to the telecom network. Also look at the way the span has been configured - it must be the same on both ends. See the <i>T1 Span Configure</i>, <i>E1 Span Configure</i> or <i>J1 Span Configure</i> messages in the <i>API Reference</i> for different configuration parameters.
-	0x02	Reserved		
Major	0x03	Excessive Burst of Slips	0x08	0x0C Logical Span AIB Slot Number Span Offset This notification occurs when the CSP detects an abnormally high number of slips. The address information represents the logical span of the span. There might be noisy T1 signals on the line, a configuration mismatch that is, B8Zs/AMI/SF/ESF etc. for T1, HDB3, CRC-4 etc for E1 spans or a bad timing source for span synchronization. Use the Span Status Query message (0x0084) which will return all Layer 1 parameters. See the <i>API Reference</i> for more details. Also, you can check your timing source. Most of the time the CSP uses a Span from the network to Time the entire CSP chassis. If that source is not good, it may trigger slips and carrier Group Alarms (CGA) on other spans.
Major	0x04	J1-Specific Failure	0x06	0x0C Logical Span AIB

Major	0x05	Logical Span ID already exists on another node	0x06	0x0C Logical Span AIB An application is trying to configure a Logical Span ID that already exists on another node. There could be a software error in SwitchMgr or an error in the configuration file. Check the configuration. Collect the alarm.log and socket.log and contact Cantata Technical Support.
Informative	0x06	Configure L3	0x08	0x0C Logical Span AIB Slot Number Span Offset

0x04 Channel Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
-	0x01	Reserved		
Inform.	0x02	ISDN D Channel Establishing (the distant end is not communicating on the D Channel)	0x07	0x0D Channel AIB ISDN D channel is trying to get established and the distant end is not communicating on the D channel. Initial configuration or the distant end has stopped communicating on the D channel. Investigate the distant end D channel.
Inform.	0x03	PPL Error Data	Variable	Refer to the PPL Error Data at the end of this message for the data format.
	0x04	Switchover Initiate		Check D Channel Out of Service condition. The Primary D channel has gone from being in-service to out-of-service. The address information represents the slot and channel of the D channel. Look for Card or Span alarms that would also indicate a hardware failure. Reset the D Channel if it does not come back inservice contact remote end network administrator to check remote end status.
	0x05	Switchover Success		The D channel switchover was successful. The new D channel is now the controller. The address information represents the span and channel of the new D channel. Investigate the cause of the switchover.

Alarm 0x00B9

	0x06	Switchover Failure		The controller switchover failed. The existing D channel is still the controlling D channel. The address information represents the span and channel of the new D channel. Investigate cause of switchover and state of the Backup D Channel.
	0x07	Backup Diagnostic		Information Alarm when the state of the D channel changes. The address information represents the span and channel of the D channel. Investigate the cause of D Channel switchover.
	0x08	SS IPDC Error		Look for other error messages that would indicate a network or system condition leading to this problem. If symptoms persist, contact Cantata Technical Support.
Major	0x09	Invalid Associated Channel	0x09	The Device Server ID and 0x0D Channel AIB.
Major	0x0A	DSP Resource Wait Timeout	0x09	The Device Server ID and 0x0D Channel AIB. A DSP Resource Wait timeout occurs when the CSP gets no response when requesting a physical channel. Could be a hardware failure. If the problem persists, contact Cantata Technical Support
Major	0x0E	EXNET Connection Error		Contact Cantata Technical Support.

0x05 DSP SIMM Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x01	DSP SIMM Taken Out of Service	0x06	0x12 DSP SIMM AIB. Check with operations personnel to verify card removal. Verify the host did not send a <i>Service State Configure</i> (0x000A) message to take the SIMM out of service. Also verify that the DSP card is still installed and powered on.
-	0x02	Reserved	0x00	No Data

Alarm 0x00B9

Inform.	0x03	Recorded Announcement Erase Complete	0x00	No Data Sent upon completion of erasure. When you have erased a VRA SIMM using <i>Recorded Announcement</i> (0x0054), this alarm indicates that the erasure is complete. The host must wait for this alarm before it begins any download.

Major	0x04	Recorded Announcement Download Inconsistency	0x00	No Data Sent upon completion of download. This alarm indicates an inconsistency between the information in a <i>Recorded Announcement Download 0x0052</i> message and the actual announcement in the <i>Recorded Announcement Download 0x0053</i> message. The inconsistency is usually caused by an incorrect checksum or announcement size. The announcement information is stored as it appears in the <i>Recorded Announcement Download 0x0053</i> message. Play out the announcement to check it. Could be caused by an incorrect checksum or announcement size. Check the announcement and delete one of the announcements.
Major	0x05	Recorded Announcement ID Inconsistency (on same card)	0x00	No Data Sent when a VRA SIMM is brought in service. This alarm indicates that an announcement uses the same ID as another announcement, with different information, on the DSP card. Both announcements have the same ID, and either announcement might be played when the ID is specified in the <i>Recorded Announcement Connect 0x0055</i> message. Indicates that the host downloaded an announcement using the same ID as another announcement, with different information on the DSP card. Check the configuration to ensure that you are not using the same ID for different RAN files.
Inform.	0x06	Recorded Announcement Download Ready	0x08	An AIB indicating the slot number: Data[0] Address Method (0x00) Data[1] No. of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6, 7] RAN ID Sent upon completion of download. The DSP-ONE card will not accept another Recorded Announcement Download Initiate message until it has sent this alarm.

Inform	0x07	Recorded Announcement File System Conversion Success	0x06	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Sent after the flash memory file system is converted. Informs the host that the RANs are now stored in the requested file system. This alarm takes three to five minutes to be generated after the host sends the file system conversion request. After this alarm you are able to bring the VRAS simm into service.
Major	0x08	Recorded Announcement File System Conversion Failure	0x07	Data Length: (0x07) Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6]:Failure Code Failure codes: VRA_FAILURE = 0, Amount of Flash Data invalid for New File System. VRA_FLASH_WRITE_FAILURE = 2, Writing to Flash failed. VRA_FLASH_ERASE_FAILURE = 3, Erasing Flash failed. VRA_RAM_WRITE_FAILURE = 4, Writing RAM failed. VRA_DATA_VALIDATION_FAILURE = 5 CRC validation failed. Sent after an unsuccessful attempt to convert the file system. Informs the host that the file system conversion process failed. You should delete the RANs on this VRA SIMM. If the file system convert fails then delete all RANs from this SIMM and try again.

Alarm 0x00B9

Major	0x09	Recorded Announcement File System Timeout	0x06	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Sent after an attempt to convert the file system times out, if the attempted deletion of entire flash memory, file system conversion, or defragmentation fails to complete in the time allowed. Try deleting each RAN from the SIMM.
Inform	0x0B	Recorded Announcement Defragmentation Success	0x06	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Sent after defragmentation of the flash memory is complete. Informs the host that the RANs now take up as little flash memory as possible. This alarm takes three to five minutes to be generated after the host sends the file system Defragment request.
Major	0x0C	Recorded Announcement Defragmentation Failure	0x07	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] Failure Code (see failure codes listed under Alarm File System Conversion Failure 0x08) Sent after an unsuccessful attempt to defragment flash memory. Informs the host that the flash memory defragmentation has failed. The host should delete the flash memory on this VRA SIMM.

Alarm 0x00B9

Inform	0x0D	Recorded Announcement Single Deletion Complete	0x08	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] RAN ID (MSB) Data[7] RAN ID (LSB) Sent in response to the message, <i>Recorded Announcement Single Delete</i>. Informs the host that the RAN ID has been marked for deletion and is no longer available for use. This alarm takes zero to 30 seconds to be generated after the host sends the delete request.
Inform	0x0E	Recorded Announcement Need Defragmentation	0x07	Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] Defragmentation Level Sent after a Recorded Announcement Single Delete has been processed and the flash memory where the RANs are stored has reached the highest level of fragmentation. Indicates that enough of the flash memory is occupied by deleted RANs to make it worthwhile to defragment the flash memory.

0x07 Node Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Minor	0x01	Not Using Extended API	0x06	Data[0] Physical Node ID, MSB Data[1] Physical Node ID Data[2] Physical Node ID Data[3] Physical Node ID, LSB Data[4] Logical Node ID Data[5] Host Node ID
Inform.	0x02	Available Conferencing Timeslot Changed	0x02	Data[0] New Timeslot Count, MSB Data[1] New Timeslot Count, LSB
Inform.	0x05	Unable to Communicate with Node		Normally when this alarm is sent to the host, it includes the filename and line number where the error occurred. Send this information to Cantata Technical Support.
Major	0x06	Remote SS7 Server Node Unavailable		Data[0] Node ID Data[1] Board Slot Number Check with network operations for other network alarms that could be related.
	0x07	0x07 Remote SS7 CIC Matrix Node Unavailable		Check with network operations for other network alarms that could be related.
Major	0x08	Remote SS7 Card Unavailable		Data[0] Number of IDs (always 1) Data[1] 1=Active SS7 Card 2=Standby SS7 Card Ensure that the Ethernet cable is plugged in CCS I/O Ethernet Port A. Check for faulty hardware, (SS7PQ, SS7HP, CCS I/O, ethernet cable, and Ethernet switch). Check with network operations for other network alarms that could be related.
Major	0x0A	Maximum Node Count Reached		
Major	0x0B	H.100 Bus Failure		This alarm occurs if the H.100 bus fails. For example, if there are no clock signals to drive the H.100 bus.
Major	0x0C	Clock B Failure		This alarm occurs if the clock B signal of the H.100 bus fails. This alarm notifies the host about the clock signal failure, so that the host can appoint another board to source the clock or take other actions.

Major	0x0D	Clock A Failure		This alarm occurs if the clock A signal of the H.100 bus fails. This alarm notifies the host about the clock signal failure, so that the host can appoint another board to source the clock or take other actions.
Major	0x0E	Cannot Be Primary A		This alarm occurs when the board could not become the primary master driving clock A, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as primary master driving clock A or take other actions.
Major	0x0F	Cannot Be Primary B		This alarm occurs when the board could not become the primary master driving clock B, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as primary master driving clock B or take other actions.
Major	0x10	Cannot Be Secondary A		This alarm occurs when the board could not become the secondary master driving clock A, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as secondary master driving clock A or take other actions.
Major	0x11	Cannot Be Secondary B		This alarm occurs when the board could not become the secondary master driving clock B, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as secondary master driving clock B or take other actions.
Major	0x12	Momentary Failure of Clock A		This alarm occurs when a momentary failure of clock A is observed and clock A recovers.
Major	0x13	Momentary Failure of Clock B		This alarm occurs when a momentary failure of clock B is observed and clock B recovers.
Major	0x14	Taking Over As Primary A		This alarm occurs when the board is acting as the secondary master, driving clock A and the primary master, driving clock B fails. Since the primary master, driving clock B has failed, the secondary master driving clock A takes over as the primary master, driving clock A. The board is taking over as the primary master driving clock A.

Major	0x15	Taking Over As Primary B		This alarm occurs when the board is acting as the secondary master, driving clock B and the primary master, driving clock A fails. Since the primary master, driving clock A has failed, the secondary master driving clock B takes over as the primary master, driving clock B. The board is taking over as the primary master driving clock B.

0x1E TFTP Alarm

NOTE: This alarm is resent every 20 seconds as long as the alarm condition remains

Length Variable

Data[0] Alarm Code

- 0x00 Cannot TFTP file
- 0x01 Invalid TFTP Configuration File Format
- 0x02 Invalid BRecord Format
- 0x03 RAM Corrupted
- 0x04 Old Timestamp
- 0x05 No timestamp supplied

Data[1] Type

- 0x02 Alarm Status (See Data[2], below)
- All other types: Cantata Use Only. Report to Cantata Technical Support.

Data[2] Status

Applies to Alarm Type 0x02 (Alarm Status) only.

- 0x00 No Status
- 0x01 TFTP device detected a protocol error
(such as a non-Data packet received or expected ACK not received. Occurs when a file is not found).
- 0x02 TFTP device timed out (Incorrect IP Address)
- 0x03 TFTP device is out of sync
- 0x04 TFTP device has no more free socket IDs
(Occurs when another TFTP Download was in progress but was aborted)
- 0x05 TFTP device cannot use a channel number given to it
- 0x06 TFTP device has not been initialized
- 0x07 No server IP Address has been given
- 0x08 No TFTP Configuration filename has been given
- 0x09 No timestamp has been given
- 0x0A A TFTP Configuration or BRecord File line is too long
- 0x0B Too much data for internal buffer
- 0x0C TFTP Configuration File line has no '='
- 0x0D TFTP Configuration File line has no second '='
- 0x0E TFTP Configuration File timestamp is missing a parameter
- 0x0F Load filename is greater than 127 characters
- 0x10 EX/CPU Label in TFTP Configuration file not set to SAVE_LOAD_TRUE
- 0x11 Not enough RAM on EX/CPU card to save all loads that are configured to be saved
- 0x12 BRecord File is out of sync. There is no 'B' starting the record.
- 0x13 BRecord receiver is out of sync. Expected a different record type.
- 0x14 Invalid BRecord Checksum
- 0x15 Invalid BRecord Count
- 0x16 Incorrect Number of Bytes in BRecord Load

Alarm 0x00B9

- 0x17 Invalid Load Checksum
- 0x18 Incorrect Load for Card
- 0x19 Load is from a different software version than the version on the EX/CPU
- 0x1A Timeout waiting for response from internal download process
- 0x1B Host download is in progress
- 0x1C TFTP Download aborted by initiation of host download
- 0x1D Timeout waiting for buffer
- 0x1E Stopped by host starting another TFTP
- 0x1F Configuration file has a new save option for an existing load
- 0x20 Operating system general error
- 0x21 Operating system I/O error

Data[3] Load Number

- 0x00 ST1LC
- 0x01 EX/CPU
- 0x02 MFDSP
- 0x03 Reserved
- 0x04 SE1LC

Alarm Cleared 0x00C1

SwitchKit Name	AlarmCleared
Type	EXS API and SwitchKit API message
Description	The CSP sends this message to indicate that an alarm previously reported in an <i>Alarm</i> message has been cleared because it has been resolved by a host action or by some external action or series of events. The following information about the originating alarm is reported: • Severity • Alarm Type • Alarm Number • Alarm Data See the <i>Alarm</i> message for Alarm Type, Alarm Number, and Data values. The <i>Data</i> will match that of the alarm that has been cleared, except for a span alarm, for which there is one byte of data indicating that the span status is 0x00 (Receiving Red) (0x000 for SwitchKit).
Related Messages	Alarm 0x00B9
Sent by	CSP
SwitchKit Code	C Structure <pre>typedef struct { UBYTE InfoSize; UBYTE Severity; UBYTE Entity; UBYTE AlarmNum; UBYTE Info[249]; } XL_AlarmCleared;</pre> C++ Class <pre>class XLC_AlarmCleared : public XLC_InboundMessage { public: UBYTE getInfoSize() const; void setInfoSize(UBYTE x); UBYTE getSeverity() const; void setSeverity(UBYTE x); UBYTE getEntity() const; void setEntity(UBYTE x); UBYTE getAlarmNum() const; void setAlarmNum(UBYTE x); const UBYTE *getInfo() const; UBYTE *getInfo(); void setInfo(UBYTE *x); };</pre>

AllInService

Type	SwitchKit API message
Purpose	Use the <i>SK_AllInService</i> message to automatically bring into service all entities referenced in the configuration file.
Description	This message is for SwitchManager configuration files. It instructs SwitchManager to bring into service any entity referenced in configuration files using <i>ServiceStateConfig</i> . AllInService saves you from having to explicitly add <i>ServiceStateConfig</i> messages for each single entity.
Sent by	SwitchManager
Configuration	<i>AllInService</i> (Node = integer, ConnectionID = integer);

AllocateChannel

Type	SwitchKit API message
Description	Use the <i>SK_AllocateChannel</i> message to manually allocate a channel outside of the standard automatic allocation functions (for example, sk_watchChannelGroup() and sk_requestOutseizedChannel()). Regardless of the channel groups that the channel is in, the LLC tries to allocate the channel specified by Span and Channel to the calling application. On success, the return Status value contains 0x00. If the channel is already allocated to another application, Status contains SK_NO_CHANNELS.
Sent by	Application
C Structure	<pre>typedef struct { unsigned short Span; UBYTE Channel; } SK_AllocateChannel;</pre>
C Structure Response	<pre>typedef struct { int Status; } SK_AllocateChannelAck;</pre>
C++ Class	<pre>class SKC_AllocateChannel : public SKC_ToolkitMessage { public: unsigned short getSpan() const; void setSpan(unsigned short x); UBYTE getChannel() const; void setChannel(UBYTE x); };</pre>
C++ Class Response	<pre>class SKC_AllocateChannelAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); };</pre>

AllocateChannelGroup

Type	SwitchKit API message
Description	Use the <i>SK_AllocateChannelGroup</i> message to manually allocate all available channels in a given channel group. If <i>GroupName</i> is not valid, then <i>Status</i> in the acknowledgment contains <i>SK_INVALID_GROUP</i> . Otherwise, it contains 0x10, and <i>Channels</i> contains a list of all the channels that have been allocated. <i>Channels</i> [0-1] will contain the first span, <i>Channels</i> [2] will contain the first channel offset, and so on, for as many channels as are specified in <i>NumChannels</i> .
Sent by	Application
C Structure	<pre>typedef struct { char GroupName[50]; UBYTE reserved67[203]; } SK_AllocateChannelGroup;</pre>
C Structure Response	<pre>typedef struct { int Status; int NumChannels; UBYTE Channels[245]; } SK_AllocateChannelGroupAck;</pre>
C++ Class	<pre>class SKC_AllocateChannelGroup : public SKC_ToolkitMessage { public: const char *getGroupName() const; void setGroupName(const char *x); };</pre>
C++ Class Response	<pre>class SKC_AllocateChannelGroupAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); int getNumChannels() const; void setNumChannels(int x); const UBYTE *getChannels() const; UBYTE *getChannels(); void setChannels(UBYTE *x); };</pre>

AllOutOfService

Type	SwitchKit API message
Purpose	Use the <i>SK_AllOutOfService</i> message to automatically take all referenced entities out-of-service on any configured node prior to sending another configuration.
Description	SwitchManager takes all entities found on any configured node out-of-service after receiving this message. Sending this message saves you from having to explicitly add <i>ServiceStateConfig</i> messages for each entity. Taking entities out-of-service prior to configuration is important to prevent system purges caused by configuring a channel that is in-service. Important! Use of <i>AllOutOfService</i> is not recommended for dynamic configurations.
Sent by	SwitchManager
Configuration	<i>AllOutOfService</i> (Node = integer, ConnectionID = integer);

Answer Supervision Mode Configure 0x00BB

SwitchKit Name	AnswerSuperviseConfig
Type	EXS API and SwitchKit API message
Description	Use this message to configure the Answer Supervision mode for a channel or range of channels. The Answer Supervision Mode options are: • Propagate Answer to Distant End • Notify Host of Answer • Propagate Answer to Distant End and Notify Host of Answer • No Answer Supervision - no propagation of answer or notification

CAUTION

Do not send this message for channels configured as the following trunk types:

- DP0
- DPT
- FX0 loopstart and groundstart (OK to use if the answer supervision mode is 0x00 or 0x03)

If you use this message for these trunk types, the CSP sends the response *Status* value “Invalid Data Type” (0x17).

Sent by	Host

Example Message (SwitchKit Socket Log Output)	The following socket log output/example message configures the Answer Supervision Mode to propagate answer to distant end for channels 0x00 - 0x17 on spans 0x01 - 0x02. 00 12 00 BB 00 00 FF 01 02 0D 03 00 01 00 0D 03 00 02 17 00

SwitchKit Code	Configuration

```
AnswerSuperviseConfig (  
    Node = integer,  
    Range = StartSpan : StartChan - EndSpan : EndChan,  
    AnswerMode = integer);
```

C Structure

```
typedef struct {  
    unsigned short StartSpan;  
    UBYTE StartChannel;  
    unsigned short EndSpan;  
    UBYTE EndChannel;  
    UBYTE AnswerMode;  
} XL_AnswerSuperviseConfig;
```

C++ Class

```
class XLC_AnswerSuperviseConfig : public  
    XLC_ChanRangeMessage {  
public:  
    unsigned short getStartSpan() const;  
    void setStartSpan(unsigned short x);  
    UBYTE getStartChannel() const;  
    void setStartChannel(UBYTE x);  
    unsigned short getEndSpan() const;  
};
```

:	Checksum		

AppConnectionQuery

Type	SwitchKit API message
Purpose	Use the <i>AppConnectionQuery</i> message to query the Low-Level Communicator (LLC) for description data of a specific application.
Description	The message is for querying the LLC for description data of a specific application. All of the data is returned in AppConnectionQueryAck. In addition to returning the application IDs of connected applications, an acknowledgement will also contain the application IDs of the primary LLC and redundant LLC.
Sent by	Application
How to use	To use an <i>AppConnectionQuery</i> message construct the message and set the application ID: <pre>SKC_AppConnectionQuery acq; acq.setAppID(app_id);</pre>
Arguments	The following table shows the user modifiable argument:

Argument	Description
AppID	Specifies the name of the specific application.

Status Field The following table shows the possible return values of the status field:

Value	Description
OK	Query successfully acknowledged
SK_NO_ACK_FROM_SWITCH	CSP did not respond.
SK_UNKNOWN_APP	You used an unknown AppID. This indicates that no application with the specified ID is connected to the LLC.
SK_NO_APP_DATA	Indicates that the application has no description data associated with it.

C Structure	<pre>typedef struct { int AppID; } <i>SK_AppConnectionQuery</i>;</pre>
C Structure Response	<pre>typedef struct { int Status; int AppID; char AppName[80]; char AppVersion[16]; int PID; char Hostname[32]; char StartTime[32]; char SkVersion[16]; char UserData[50]; } <i>SK_AppConnectionQueryAck</i>;</pre>
C++ Class	<pre>class <i>SKC_AppConnectionQuery</i> : public SKC_ToolkitMessage { public: int getAppID() const; void setAppID(int x); };</pre>
C++ Class Response	<pre>class <i>SKC_AppConnectionQueryAck</i> : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); int getAppID() const; void setAppID(int x); const char *getAppName() const; void setAppName(const char *x); const char *getAppVersion() const; void setAppVersion(const char *x); int getPID() const; void setPID(int x); const char *getHostname() const; void setHostname(const char *x); const char *getStartTime() const; void setStartTime(const char *x); const char *getSkVersion() const; void setSkVersion(const char *x); const char *getUserData() const; void setUserData(const char *x); };</pre>

AppDescriptionData

Type	SwitchKit API message
Description	The message <i>AppDescriptionData</i> is used by the function <i>sk_appDescriptionData()</i> that provides additional information to help uniquely identify the application. This message does not have a response acknowledgment.
Sent by	Function sk_appDescriptionData()
C Structure	<pre>typedef struct { } SK_AppDescriptionData;</pre>
C++ Class	<pre>class SKC_AppDescriptionData : public SKC_AdminMessage { public: };</pre>

AppPopulationQuery

Type	SwitchKit API message
Purpose	Use the <i>SK_AppPopulationQuery</i> to query the application IDs of all applications connected to the Low-Level Communicator (LLC).
Description	The <i>AppPopulationQuery</i> message requires no arguments. The message is used for querying the application IDs of all applications connected to the LLC. All IDs are returned in the <i>AppPopulationQueryAck</i> message.
Sent by	Application
How to use	To use an <i>AppPopulationQuery</i> , construct the message with no argument: SKC_AppPopulationQuery apq;
Status Field	The following table shows the possible return values of the status field:

Value	Description
OK	Query successful acknowledged.
SK_NO_ACK_FROM_SWITCH	The CSP did not respond.

C Structure	typedef struct { } <i>SK_AppPopulationQuery</i> ;
C Structure Response	typedef struct { int Status; int NumApps; int AppIDs[50]; } <i>SK_AppPopulationQueryAck</i> ;
C++ Class	class <i>SKC_AppPopulationQuery</i> : public SKC_ToolkitMessage { public: };

C++ Class Response

```
class SKC_AppPopulationQueryAck : public SKC_ToolkitAck
{
public:
    int getStatus() const;
    void setStatus(int x);
    int getNumApps() const;
    void setNumApps(int x);
    const int *getAppIDs() const;
    void setAppIDs(const int *x);
};
```

ARP Cache Query 0x00FC

SwitchKit Name ARPCacheQuery

Type EXS API and SwitchKit API message

Description: Use this message to query or flush the entries in a module's ARP cache. If a query is sent, the CSP returns the data in an *ARP Cache Report* message. You can query a specific module by using the ARP query TLV. If the amount of data returned exceeds the 512 byte maximum limit of a host message, the CSP sends multiple messages. To remove entries, use the ARP Remove TLV. You can remove multiple entries by including multiple TLVs. The CSP returns a Status of Positive Acknowledgment (0x000A) upon removal.

NOTE: Entries are automatically flushed from the table if not accessed within five minutes after the connection is torn down.

Sent by: Host

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE AddrInfo[30];
    UBYTE TLVDataType;
    UBYTE TLVCount;
    UBYTE TLVData[221];
} XL_ARPCacheQuery;
```

C++ Class

```
class XLC_ARPCacheQuery : public XLC_OutboundMessage {
public:
    virtual int getTag() const;
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    // Extended addressing functions
    // Slot AIB functions
    UBYTE getSlot() const;
    void setSlot(UBYTE x);
    UBYTE getTLVDataType() const;

ARP Cache Report 0x00FB

SwitchKit Name ARPCacheReport

Type EXS API and SwitchKit API message

Description: This message is sent by the CSP in response to an *ARP Cache Query* message. The report includes the IP address and Ethernet address for each entry queried. If the ARP cache size is larger than 512 bytes, multiple messages are sent.

SwitchKit Users

If you want to get this report, you must register for it by calling the `sk_msgRegister` function with the parameter, `SK_ARP_CACHE_REPORT`.

Sent by: CSP

Resent in EXS API: This message is resent once after five seconds.

Assign EXS Host/Slave 0x006E

SwitchKit Name	AssignEXSHostSlave
Type	EXS API and SwitchKit API message
Description	Use this message to establish a relationship between a host node and a slave node in a CSP system. You can route this message through any node. If you indicate the same node as both the host node and the slave node, the CSP returns the response status 0xFC (Invalid Logical Node ID). NOTE: Do not use this message to establish a node as a host node. A node becomes a host node when any API message is sent to it through a direct TCP connection.

Sent by Host

SwitchKit Code Configuration

```
AssignEXSHostSlave(
    Node = integer,
    HostNode = integer,
    SlaveNode = integer);
```

C Structure

```
typedef struct {
    BaseFields Base;
    UBYTE HostNode;
    UBYTE SlaveNode;
} XL_AssignEXSHostSlave;
```

C Structure Response

```
typedef struct {
    BaseFields Base;
    unsigned short Status;
    unsigned short Span;
    UBYTE Channel;
} XL_AssignEXSHostSlaveAck;
```

C++ Class

```
class XLC_AssignEXSHostSlave : public
    XLC_OutboundMessage {
public:

		:	Checksum

Assign Logical Node ID 0x0010

SwitchKit Name	AssignNode
Type	EXS API and SwitchKit API message
Description	Use this message to assign a logical node ID to a CSP that is a node in a multi-node system. If the node has an EXNET-ONE card installed or if you plan to have an EXNET-ONE card installed, you must assign the node ID at configuration. The default logical node ID for a stand-alone CSP is 0xFF. To specify the node that you are assigning a logical ID, you use its physical node ID (serial number). NOTE: For SwitchKit, DO NOT use the <i>XL_AssignNode</i> message with EXS SwitchKit. <i>XL_AssignNode</i> is obsolete with the introduction of <i>SK_AddLLCNode</i>.
Sent by	Host
Example Message (SwitchKit Socket Log Output)	In the following socket log output/example message, the host assigns logical node ID 01 to the physical node 0000 23AC for the first time: 00 0D 00 10 00 00 FF 00 01 10 05 00 00 23 AC 01

SwitchKit Name	AssignSpan
Type	EXS API and SwitchKit API message
Description	Use this message to map a logical span ID to a physical location. You must assign a unique ID to each span in the system before you can configure any spans or channels.
Sent by	Host
Example Message (SwitchKit Socket Log Output)	In the following socket log output/example message, the host assigns spans in a single node system to offset 00 in a VDAC-ONE card. 00 0D 00 A8 00 00 FF 01 00 01 11 04 A8 01 00

SwitchKit Code Configuration

```
AssignSpan (
    Node = integer,
    Span = integer,
    Slot = integer,
    Offset = integer

);
```

C Structure

```
typedef struct {
    UBYTE AddrInfo[30];
    UBYTE reserved48[222];
} XL_AssignSpan;
```

C Structure Response

```
typedef struct {
    unsigned short Status;
    UBYTE reserved6[13];
    UBYTE AddrInfo[30];
    UBYTE reserved50[220];
} XL_AssignSpanAck;
```

C++ Class

```
class XLC_AssignSpan : public XLC_SlotMessage {
public:
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    // Extended addressing functions
    // Assign Span AIB functions
    XBYTE getSpan() const;
    void setSpan(XBYTE x);
    UBYTE getSlot() const;
```

```

void setSlot(UBYTE x);
UBYTE getOffset() const;
void setOffset(UBYTE x);
};

```

C++ Class Response

```

class XLC_AssignSpanAck : public XLC_AcknowledgeMessage
{
public:
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    // Extended addressing functions
    // Assign Span AIB functions
    XBYTE getSpan() const;
    void setSpan(XBYTE x);
    UBYTE getSlot() const;
    void setSlot(UBYTE x);
    UBYTE getOffset() const;
    void setOffset(UBYTE x);
};

```

EXS API Hex Format

MESSAGE (White)		RESPONSE (Gray)	
Byte	Field Description	Byte	Field Description
0	Frame (0xFE)	0	Frame (0xFE)
1, 2	Length (0xNNNN)	1, 2	Length (0xNNNN)
3, 4	Message Type (0x00A8)	3, 4	Message Type (0x00A8)
5	Reserved (0x00)	5	Reserved (0x00)
6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
:	<u>AIB</u> Address Method 0x00 - Individual AEs	8, 9	Status MSB, LSB 0x007F Software Module Locked See also the Common Response Status Values chapter
	Number of AEs to follow	:	<u>AIB</u> Same as message.
	AE 0x11 Logical/Physical Span To de -assign spans, see AIB below table.		Checksum
	Checksum		:

0x11 Logical Span AIB for De-Assigning Spans

To de-assign a physical span, logical span, or all spans, use the field values as shown in the table below in the *Assign Logical Span ID* message (0x00A8).

Byte	AIB Field Description			
0	Address Method: 0x00			
1	Number of AEs: 0x01			
2	Address Element: 0x11			
3	Data Length: 0x04			
		All Spans	Physical Span ID	Logical Span ID
4	Data[0] Logical Span ID, MSB	0xFF	0xFF	Valid Logical Span
5	Data[1] Logical Span ID, LSB	0xFF	0xFF	Valid Logical Span
6	Data[2] Slot	0xFF	Valid Physical Slot	0xFF
7	Data[3] Physical Span	0xFF	Valid Span Offset	0xFF

NOTES:

1. De-assigning a Logical Span ID takes the span, and all channels on the span, out of service.
2. De-assigning a span resets its configuration to the default values. When you want to re-initialize a card's configuration (for example, when you restart a host application) use the *Reset Configuration* message.
3. When you de-assign a span, you do **not** receive a *DS0 Status Change* message with a *Channel Status* field value 0x01 (Out of Service) for every channel on the span. Assume that all channels on a de-assigned span are out of service.
4. De-assigning all spans will clean up all virtual slots which acts as if the virtual cards were removed.

Associate Chan Group

Type	SwitchKit API message
Description	Use the <i>SK_AssociateChanGroup</i> message to associate a ChannelGroup with specified channels. <i>SK_AssociateChanGroup</i> commands are cumulative. To build a non-contiguous channel group, issue multiple commands. Furthermore, as long as the Low-Level Communicator (LLC) is running, the channel groups are in force. It is recommended that in your configuration files, you have a <i>SK_ClearChanGroup</i> for all the channel groups you intend to use. Important! In channel management, if an application specifies a channel group that was not configured in LLC using an <i>AssociateChannelGroup</i>, the LLC will create that group and assign no channels to that channel group. When <i>AssociateChannelGroup</i> is sent to the LLC, LLC will add the specified channels to that group. If sent by SwitchManager, and <i>SK_AssociateChanGroup</i> includes any signaling channels (D Channel, Link or R2 signaling channel), SwitchManager will exclude those channels from that group. In case an application is responsible for building the groups of channels, the application must call the function <i>sk_associateChannelGroup()</i>. That function then uses the message to create the specified groups.
Sent by	SwitchManager or Application
Configuration	<pre><i>AssociateChanGroup</i>(ChannelGroup = quoted string, range = startSpan:startChannel - endSpan:endChannel);</pre>
C Structure	<pre>typedef struct { unsigned short StartSpan; unsigned short EndSpan; UBYTE StartChannel; UBYTE EndChannel; char ChannelGroup[45]; } SK_AssociateChanGroup;</pre>
C++ Class	<pre>class SKC_AssociateChanGroup : public SKC_AdminMessage { public: unsigned short getStartSpan() const;</pre>

```
void setStartSpan(unsigned short x);  
unsigned short getEndSpan() const;  
void setEndSpan(unsigned short x);  
UBYTE getStartChannel() const;  
void setStartChannel(UBYTE x);  
UBYTE getEndChannel() const;  
void setEndChannel(UBYTE x);  
const char *getChannelGroup() const;  
void setChannelGroup(const char *x);  
};
```

Example The following is an example of AssociateChanGroup for Group Name “all”, with a range of span 0/channel 0 - span 2/channel 23.

```
AssociateChanGroup(  
    groupname = "all",  
    range = 0:0-2:23);
```

If span 0/channel 23 were a D Channel, SwitchManager would split the message as follows:

```
AssociateChanGroup(  
    groupname = "all",  
    range = 0:0-0:22);
```

```
AssociateChanGroup(  
    groupname = "all",  
    range = 1:0-2:23);
```

B Channel Configure 0x00C8

SwitchKit Name BChannelConfig

Type EXS API and SwitchKit API message

Description Use this message to configure the following information contained in ISDN PRI messages associated with outgoing B channel calls:

- Network Type (network-specific facilities)
- Outgoing Information Transfer Capability
- Calling Number Type
- Calling Number Plan ID
- Calling Presence Indicator
- Calling Screening Indicated
- Called Number Type
- Called Number Plan ID
- Outgoing Response Enable Values

Related API Messages • *B Channel Query* 0x00CA (SwitchKit Name: BChannelQuery)

Sent by Host

Become Active 0x00A1

SwitchKit Name ActivateMatrix

Type EXS API and SwitchKit API message

Description **For EXS API**

Use this message to initiate a switchover in an CSP with a redundant Matrix Controller or SS7 card. You must send this message to the standby Matrix Controller from the matrix host or send this message to the standby SS7 card from the SS7 local host. If you send this message to the active Matrix Controller or active SS7 card, it has no effect on the CSP.

Cantata recommends sending this message from the Matrix host to initiate a switchover to the standby Matrix Controller or sending this message from the SS7 local host to initiate a switchover to the standby SS7 card.

For SwitchKit API

ActivateMatrix() initiates a Matrix switchover regardless of what parameters are passed in. With EXS SwitchKit you must send a function call to **sk_activateExnetMatrix()**. You cannot send the message directly to the standby Matrix Controller.

EXS SwitchKit API does not support sending this message from the host to the standby SS7 card.

Sent by Host

EXS API Hex Format

MESSAGE (White)		RESPONSE (Gray)

BroadcastLoad

Type	EXS SwitchKit API message
Purpose	Do not use this message. This is an internal message used by the function call <i>sk_broadcastLoad()</i> , refer to the <i>EXS SwitchKit Programmer's Guide</i> for information on the <i>sk_broadcastLoad()</i> function.
Description	The Low-Level Communicator (LLC) uses the load value to determine how to distribute the load across several applications that are load sharing.
Sent by	Function <i>sk_broadcastLoad()</i>

Busy Out 0x0018

SwitchKit Name	BusyOut
Type	EXS API and SwitchKit API message
Description	Use this message to “busy out” a channel or range of channels. This allows the host to control the incoming call rate by busying out a selected group of channels, normally on the front end of a system. You can busy out channels configured with the following trunk types only: • E&M • FXO Loop Start • FXO Ground Start
Related API Messages	<i>Busy Out Flag Configure 0x00D3</i> (SwitchKit Name: BusyOutFlagConfig)

SwitchKit Name	BusyOutFlagConfig
Type	EXS API and SwitchKit API message
Description	Use this message to enable the busy out feature on a channel or range of channels. You cannot “busy out” a channel with the <i>Busy Out</i> message if the <i>Flag</i> field in this message is disabled (0x00). Only channels configured with a trunk type of E&M, FXO Loop Start, or FXO Ground Start can be busied out.

Call Control Instructions Query 0x0087

SwitchKit Name	CallControlInstructionQuery
Type	EXS API and SwitchKit API message
Description	Use this message to query the preprogrammed inseize and outseize call control instructions on a channel or range of channels. The response lists the instructions using three bytes each for 20 inseize and 20 outseize instructions, even if they are not all configured.
Sent by	Host

Call Processing Event 0x002E

SwitchKit Name	CallProcessingEvent
Type	EXS API and SwitchKit API message
Description	The CSP uses this message to report a call processing event on a specified channel. The event to be reported is specified by the host in the messages that support the generation of call processing events.
Sent by	CSP
Resent in EXS API	This message is resent once after five seconds.

SwitchKit Code C Structure

```
typedef struct {
    UBYTE AddrInfo[30];

:	Data These fields provide the specific information for each Event. The length and contents of the information depend on the Event. Some events contain no data. Valid entries for this field are listed below by <i>Call Processing Event</i> field value. 0x02 Digits Data[0] Number of Stages Reported Data[1] Impulsed Stage Number Data[2] Impulsed Stage Status Data[3] Stage String Count Data[4] String 1: Digit Count Data[5] String 1: First BCD Encoded Digit Pair : Data[n] String 1: Last BCD Encoded Digit Pair Data[n+1] String 2: First BCD Encoded Digit Pair : Data[m] String 2: Last BCD Encoded Digit Pair Data[4–n] are repeated for each string reported. Data[1–n] are repeated for each stage reported. Stage Status The system reports the stage status for each of the four stages. Timers can be configured. Valid entries for this field are as follows: 0x10 Positive Acknowledgment - Digits received 0x80 Partial Dial Condition - Receive Inter-digit Duration timer expired 0x81 Permanent Signal Condition - Receive 1st Digit Detection timer expired 0x91 Impulse Stage Not Collected - Stage not collected; no further stage information will be reported. 0x92 Digit Complete Timeout If the <i>Call Processing Event</i> message is in response to a <i>DSP Service Request</i> or <i>Collect Digit String</i> message, the Impulsed Stage Number is 0xFF. When the digits are collected using a KP_ST framed digit string collection method, the KP_ST digits are not contained in the reported string. 0x0D Backward R2 Signal Data[0] R2 Signal Value (0x01–0x0F) 0x0E First Digit Report Data[0] DTMF/MFR1 Digit Value (0x00–0x0F)

Call Processing Event 0x002E

0x0F	PPL Event
Data[0]	PPL Event Number (0x00–0xFF)
0x10	Digit with Timing Information. An asterisk (*) denotes a byte that is always set to “1”
Data[0]	Number of Stages Reported *
Data[1]	Impulsed Stage Number
Data[2]	Impulsed Stage Status
Data[3]	Stage String Count *
Data[4]	Digit Count *
Data[5]	BCD-encoded Digit
Data[6, 7]	Digit Duration (in 10 ms units)

The Impulsed Stage Number will be 0xFF if the *Call Processing Event* message is in response to a *DSP Service Request* or *Collect Digit String* message. The maximum time detected for digit duration is 26.35 seconds. When actual digit duration is greater than 26.35 seconds, it reports as 26.35 (0x0A4B) seconds. Only a *DSP Service Request* message request can result in the Call Processing Event of "Digit With Timing Information" being returned by the CSP.

0x27	PPS_MPS frame received
0x28	PPS_NULL frame received
0x29	PPR_PRI_EOM frame received
0x2A	PPS_PRI_EOP frame received
0x2B	PPS_PRI_MPS frame received
0x2C	PRI_EOM frame received
0x2D	PRI_EOP frame received
0x2E	PRI_MPS frame received
0x31	RNR frame received
0x32	RR frame received
0x33	RTN frame received
0x34	RTP frame received
0x41	Receiver is not ready to continue
0x44	Got end of a page
0x45	Last document in the queue was processed

Phase E - Call Release

Set Event Bit 0x10

0x05	DCN frame received
0x0A	Go to B point in T.30 flow chart
0x1F	Transition to C-point on T.30 flow charts
0x65	FAX Protocol Complete only for Send FAX
0xFFFF0	FAX I/O Complete for RCV FAX and Send FAX
0xFE	FAX Failed

Timer Event

Set Event Bit 0x20

0x03	Hardware failure timer expired
0x0D	T1 timer expired
0x0E	T4 timer expired
0x3B	T2 timer expired (see T.30)
0x4B	T3 timer expired
0x4F	T5 timer expired

Data Pump

Set Event Bit 0x40

0x02	T.30 is ready to receive
0x04	T.30 is ready to transmit
0x10	Hardware close completed
0x51	V.21 receiver has started to send preamble
0x52	V.21 receiver has completed operation
0x53	V.21 transmitter has started to send preamble
0x54	V.21 transmitter has completed operation
0x55	High-speed receiver has started to send preamble
0x56	High-speed receiver has received TCF, no errors
0x57	High-speed receiver has received TCF with errors
0x58	High-speed transmitter has started to send TCF
0x59	High-speed transmitter has completed TCF
0x5A	High-speed transmitter has started
0x5B	High-speed transmitter has completed operation
0x5C	High-speed receiver has started to send preamble
0x5D	High-speed receiver has lost carrier
0x5E	V21 Receive Frame
0x5F	V21 Transmit Frame
0x62	V21 signal detected by the HS receiver
0x63	Modem subsystem ready to transmit
0x64	Modem subsystem ready to receive
0x65	Modem subsystem has stopped operations
0x79	Non-Standard facilities (NSF) frame sent or receive
0x7A	Non-Standard facilities Set-up (NSS) frame sent or receive
0x7B	Non-Standard facilities Command (NSC) frame sent or receive
0x7C	Called Subscriber Identification (CSI) frame sent or receive
0x7D	Transmitting Subscriber Identification (TSI) frame sent or receive
0x7E	Calling Subscriber Identification (CIG) frame sent or receive
0x7F	Selective Polling (SEP) frame sent or receive
0x80	Subaddress (SUB) frame sent or receive

Call Progress Analysis Class Configure 0x00B3

SwitchKit Name CPAClassConfig

Type EXS API and SwitchKit API message

Description Use this message to add a pattern, delete a pattern, or to change the parameters of a pattern in a call progress analysis class.

Sent by Host

Overview of message The following table provides an overview of this message. The table following it, provides the detail for each byte.

MESSAGE (White)		RESPONSE (Gray)

    UBYTE UpdateFlag;
    UBYTE Class;
    UBYTE Action;
    UBYTE Data[250];
```

```
    } XL_CPAClassConfig;
```

C++ Class

```
class XLC_CPAClassConfig : public XLC_OutboundMessage {  
public:  
    UBYTE getUpdateFlag() const;  
    void setUpdateFlag(UBYTE x);  
    UBYTE getClass() const;  
    void setClass(UBYTE x);  
    UBYTE getAction() const;  
    void setAction(UBYTE x);  
    const UBYTE *getData() const;  
    UBYTE *getData();  
    void setData(UBYTE *x);  
};
```

EXS API Hex Format - Detailed

MESSAGE (White)		RESPONSE (Gray)	
Byte	Field Description	Byte	Field Description
0	Frame (0xFE)	0	Frame (0xFE)
1	Length, MSB	1	Length, MSB (0x00)
2	Length, LSB (N)	2	Length, LSB (0x07)
3	Message Type, MSB (0x00)	3	Message Type, MSB (0x00)
4	Message Type, LSB (0xB3)	4	Message Type, LSB (0xB3)
5	Reserved (0x00)	5	Reserved (0x00)
6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
		8, 9	Status MSB, LSB
		10	Checksum
8	Update All Flag (see also text below this table) 0x00 Store new configuration but do not use it. Use if you are sending more configuration messages. Use for a new configuration that changes many parameters. The CSP does not use the new configuration until the last message has 0x01 in this field. 0x01 Use new configuration immediately Use in the last configuration message. When the CSP detects this value, it uses this and all stored configuration commands to define a new call progress analysis class configuration. This field indicates whether you are going to update all fields with the configuration that you are defining in this and previous messages. For example, suppose you are updating several characteristics of call progress analysis. To do so, you are sending several of these <i>CPA Class Configure</i> messages. To prevent the CSP from performing a call progress analysis with a half-old and half-new configuration, you store the new configuration commands until the last new command is sent to the CSP. The <i>Call Progress Analysis Configuration Query</i> message reports configuration changes even when the <i>Update All Flag</i> is not set. But detection does not take place until the flag is set to 0x01.		
9	Class ID This field indicates the class number, which contains the information for detecting one group of patterns.		
10	Action 0x01 Add member pattern 0x02 Delete member pattern 0x03 Change class parameter		

11 . . .	Data[0-n] This field or set of fields provides the necessary information to perform the action indicated in the <i>Action</i> field. 0x01 Add Member Pattern Data[0] Pattern ID 0x02 Delete Member Pattern Data[0] Pattern ID 0x03 Change Class Parameter For parameter definitions, refer to the appropriate Developer's Guide. Data[0] Parameter 0x01 Mode* 0x02 Start Delay** 0x03 Continuous Silence Timeout** 0x04 Time to Wait for Pattern Confirmation** 0x05 Time to Wait after Confirmation and No Report** 0x06 Minimum Frequency Glitch Time* 0x07 Minimum Silence Glitch Time** 0x08 Maximum On Timer** 0x09 Maximum Off Timer** 0x0A Advanced Answer Detect*** 0x0B Mode Specific 1† 0x0C Mode Specific 2‡ *If Data[0] is 0x01, Data[1–2] are as follows: Data[1] Reserved Data[2] Mode This field is a bit mask that defines the mode. (0 = disabled, 1 = enabled). To enable multiple options, 'or' the bits together. Bit 0 Advanced Answer Detect Bit 1 Energy Detection Bits 2–7 Reserved **If Data[0] is 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, or 0x09, Data[1–2] are as follows: Data[1] The time in 10-ms units, MSB Data[2] The time in 10-ms units, LSB ***If Data[0] is 0x0A, Data[1–2] are as follows: Data[1] 0x00 Data[2] Number of Frequency Bursts in 500 ms before answer is declared

	†If Data[0] is 0x0B, Data[1–2] are as follows: Data[1] 0x00 (Reserved) Data[2] Sensitivity Level (for more information on Energy Detection mode, refer to the DSP Series 2 Card Product Description in the Developer's Guide Overview). 0x00 0 dBm 0x01 5 dBm 0x02 10 dBm 0x03 15 dBm 0x04 20 dBm 0x05 25 dBm 0x06 30 dBm ‡If Data[0] is 0x0C, Data[1–2] are as follows: Data[1] Scan Duration in 20-ms increments, MSB Data[2] Scan Duration in 20-ms increments, LSB The value must be expressed in 20 ms increments, using 10 ms units. For example, you should use 0x0002 = 20 ms, 0x0004 = 40 ms, and so on. The CSP rounds down odd values. For example, the system rounds down 0x0003 to = 20ms. For more information on Energy Detection mode, refer to the appropriate Developer's Guide.
:	Checksum

Example 1 The table that follows shows a message that changes the number of frequency bursts per 500 ms (before declaring answer) to “5.”

MESSAGE		
Byte	Field	Field Value
0	Frame	0xFE
1	Length, MSB	0x00
2	Length, LSB	0x0B
3	Message Type, MSB	0x00
4	Message Type, LSB	0xB3
5	Reserved	0x00
6	Sequence Number	0x01
7	Logical Node ID	0xFF
8	Update All Flag	0x01
9	Class ID	0x00
10	Action	0x03 (Change Class Parameter)
11	Data[0] Parameter	0x0A (Advanced Answer Detect)
12	Data[1] Number of Frequency Bursts, MSB	0x00
13	Data[2] Number of Frequency Bursts, LSB	0x05 (5 bursts per 500 ms)
14	Checksum	0xD1

Example 2 This example shows the message sequence you would use to change the mode of Call Progress Analysis Class 3 to Energy Detection, with a sensitivity level of -30 dBm and a scan duration of 60ms.

To change the mode, you send the following three *Call Progress Analysis Class Configure* messages in this sequence:

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x01 (Mode)
10	Data[1] – Reserved	0x00
11	Data[2] – Mode	0x02 (Energy Detection enabled)

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x0B (Mode Specific 1)
10	Data[1] – Reserved	0x00
11	Data[2] – Sensitivity Level	0x06 (-30 dBm)

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x0C (Mode Specific 2)
10	Data[1] – Reserved	0x00
11	Data[2] – Scan Duration	0x06 (60 ms)

Call Progress Analysis Configuration Query 0x008A

SwitchKit Name	CPAConfigQuery
Type	EXS API and SwitchKit API message
Description	Use this message to query call progress analysis (CPA) configuration information.
Sent by	Host

SwitchKit Code C Structure

```
typedef struct {  
    UBYTE QueryEntity;  
    UBYTE DataType;  
} XL_CPAConfigQuery;
```

C Structure Response

```
typedef struct {  
    unsigned short Status;

6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
		8, 9	Status MSB, LSB
		10	Checksum
8	Update All Flag 0x00 Store new configuration but do not use it. Use this value if you are sending more configuration messages. You use this value for a new configuration that changes many parameters. The system does not use the new configuration until the last message has 0x01 in this field. 0x01 Use new configuration immediately. Use this value in the last configuration message. When the system detects this value, it will use this and all stored configuration commands to define a new call progress analysis class configuration. This field indicates whether or not you are going to update all fields with the configuration you are defining in this and previous messages. For example, suppose you are updating several characteristics of call progress analysis. To do so, you send several of these <i>Call Progress Analysis Pattern Configure</i> messages. To prevent the CSP from performing a call progress analysis with a half-old and half-new configuration, you store the new configuration commands until the last new command is sent to the CSP. The <i>Call Progress Analysis Configuration Query</i> message reports configuration changes even when the <i>Update All Flag</i> is not set; however, detection does not happen until the flag is set to 0x01.		

Call Progress Analysis Pattern Configure
0x00B2

9	Pattern ID The number of the pattern to add, delete, or change. The following are the default IDs. Because you can modify the patterns, your pattern IDs may not correspond to this list. 0x01 Ringback 0x02 Double Ringback 0x03 Busy 0x04 Reorder 0x05 PBX Intercept 0x06 SIT Intercept 0x07 Vacant Code 0x08 Reorder-SIT 0x09 No Circuit LEC 0x0A Reorder-Carrier 0x0B No Circuit-Carrier 0x0C PBX DIALtone 0x0D Standard DIALtone 0x0E CPC Detection
10	Action 0x01 Add/Replace Pattern 0x02 Delete Pattern 0x03 Change Pattern Parameter
11 . . .	Data[0-N] This set of data fields provides the necessary information to perform the action indicated in the <i>Action</i> field. Valid entries for this field are listed below by <i>Action</i> field value. 0x01 Add/Replace Pattern - Data[0] Pattern ID (Value to be returned upon detection) - Data[1] Tone Group ID - Data[2] Pattern Configuration - This data byte is a bit mask you use to set the configuration options of a pattern. You can set multiple bits. <u>Bit</u> 0 Last Interval Continuous 1 Detect Tone After Determination 2 Use as Internal DIALtone 3–7 Reserved - Data[3] CPA Report on Pattern Loss (for example, Answer) - Data[4] Interval Cycles to Match - Data[5] Interval Cycles to Report - Data[6] Reserved - Data[7] Interval Descriptor Count (maximum is 8)

Call Progress Analysis Pattern Configure
0x00B2

	<u>Interval Descriptor 1</u> Data[8] Tone ID (0x00 for silence) Data[9] Reserved (0x00) Data[10,11] Minimum filter (given in 10ms units) Data[12,13] Maximum filter (given in 10ms units) : <u>Interval Descriptor N</u> Data[N] Tone ID (0x00 for silence) Data[N+1] Reserved (0x00) Data[N+2, N+3] Minimum filter Data[N+4, N+5] Maximum filter

13	Checksum	0xC1

Call Progress Analysis Result 0x0034

SwitchKit Name	CPAResult
Type	EXS API and SwitchKit API message
Description	The CSP sends this message to report the result of Call Progress Analysis on a channel. Only one result is reported per message.
Sent by	CSP

SwitchKit Code C Structure

```
typedef struct {  
    unsigned short Span;  
    UBYTE Channel;  
    UBYTE Result;  
    UBYTE Diag1;  
    UBYTE Diag2;  
    UBYTE Diag3;  
} XL_CPAResult;
```

C++ Class

```
class XLC_CPAResult : public XLC_OneChannelMessage {  
public:  
    unsigned short getSpan() const;  
    void setSpan(unsigned short x);  
    UBYTE getChannel() const;  
    void setChannel(UBYTE x);  
    UBYTE getResult() const;  
    void setResult(UBYTE x);

CancelUserTimer

Type:	SwitchKit API message
Description	Use this message to cancel a previously sent <i>UserTimer</i> message or group of <i>UserTimer</i> messages. This will cause the canceled timer to go off with a negative status value, SK_CANCELED. All handler functions which are installed to handle <i>UserTimer</i> expirations should be prepared to do nothing if the Status is not positive. If you want to cancel a <i>UserTimer</i>, the GroupTag should be set when the <i>UserTimer</i> is sent. This GroupTag should be saved for later use. When you want to cancel that timer, you need to send a <i>CancelUserTimer</i> message with the appropriate GroupTag entered. All currently unexpired <i>UserTimer</i> messages from that application with the corresponding GroupTag are canceled, and the acknowledgment sent back will contain the number of timers that were canceled. Depending on how the <i>UserTimer</i> messages are set up, you can cancel a set of <i>UserTimer</i> messages with a single <i>CancelUserTimer</i> message. It is important to realize that the GroupTag domain is unique to each application. This prevents one application from canceling another application's <i>UserTimer</i>. If multiple applications use the same GroupTag in a timer, and one application cancels that tag, only the timers from that application will be canceled. All other timers will still expire normally.
Sent by	Application
Arguments	The following table shows the arguments that you can modify:

Argument	Description
GroupTag	Cancellation of a timer requires that this field be set at creation of the timer and then remembered. When you want to cancel that timer, you need to send a <i>CancelUserTimer</i> message with the appropriate GroupTag entered. All currently unexpired UserTimer messages from that application with the corresponding GroupTag are canceled. It is important to realize that the GroupTag domain is unique to each application. This prevents one application from canceling another application's <i>UserTimer</i>. If multiple applications use the same GroupTag in a timer, and one application cancels that tag, only the timers from that application will be canceled. All other timers will still expire normally.

:	Card Status This field is a bit mask that applies to the following cards: Matrix Controller, T-ONE, E-ONE, J-ONE, DS3, EXNET-ONE, SS7-PQ, SS7 Series 3, DSP-ONE, MFDSP, DSP Series 2, ISDN PRI, ISDN Series 3, ST1LC, SE1LC, SJ1LC, VDAC-ONE, IP Network Interface Series 2, IP Signaling Series 3 Bit 0–1 Reset Reason 0 Cantata use only 1 Power-up 2 Cantata use only 3 Reset button pushed 2–3 Card State 0 In service 1 The CSP has taken the card out of service 2 The host has taken the card out of service 3 The host has put the card in a standby state 4 Invalid battery-backed configuration data. The host must reconfigure the card 5 Faults are logged Faults may be obtained using a <i>Fault Log Query</i> message. Obtain a Fault Log and report it to Cantata Technical Support as soon as possible. 6 Failed confidence tests. Information about the confidence test which failed is in the "Confidence Test Results" field. 7 General hardware failure The card is off-line and must be serviced. See the Hardware Configuration Field for additional information on the ISDN PRI card.

	Fan Tray Bit 0 Reserved 1 Fan 6 failed 2 Fan 5 failed 3 Fan 4 failed 4 Fan 3 failed 5 Fan 2 failed 6 Fan 1 failed 7 General hardware failure. The card is off-line and must be serviced. Power Supply Card Bit 0 Module 3 failed 1 Module 3 in tolerance 2 Module 2 failed 3 Module 2 in tolerance 4 Module 1 failed 5 Module 1 in tolerance 6 Out of Tolerance 7 General hardware failure. The card is off-line and must be serviced. DS3, T1, E1, and J1 Redundant and Standby I/O Cards Bit 0–5 Reserved 6 Output Enabled 7 Relays Enabled (0=Normal, 1=Switchover)
:	Confidence Test Results This field is bit-defined. It applies to the Matrix Controller cards and line cards. Bit 0–5 Reserved 6 Bit set indicates RAM test failure 7 Bit set indicates ROM checksum failure
:	PC Artwork Revision An ASCII character in the range "A" to "Z" (0x41–0x5B) that indicates the revision level of the card's Printed Circuit Artwork.
:	Functional Revision The card's functional revision level
:	ROM Major Revision The major revision level of the firmware running on the card.
:	ROM Minor Revision The minor revision level of the firmware running on the card.
:	RAM Major Revision The major revision level of the system software running on the card.
:	RAM Minor Revision The minor revision level of the system software running on the card.
:	Serial Number MSB, LSB This two-byte field indicates the serial number of the card.
:	RAM Size MSB, LSB This two-byte field indicates the amount of RAM on the card, in 1K increments. For the VDAC VoIP Card and VDAC VoIP Module, RAM is measured in 1 MB increments.

:	Card Information (Field length varies) The card information, including the length of the field, varies per card type. The system uses the value 0x00 for fields that do not apply to the card or for all fields, if there is no card information. IP Signaling Series 3 Card No card specific or hardware specific information is sent for this card. T-ONE, E-ONE, J-ONE, DS3, ST1LC, SE1LC, VDAC-ONE, IP Network Interface Series 2, and SS7 Multi- Protocol cards. The card information for these cards indicates the logical spans assigned to the card. The logical spans are indicated in the Logical Span AIB (0x0C) as shown below. The CSP uses the value 0xFF to indicate that no span has been assigned. An AIB for a 4-span line card has four address elements and the value 0x00 for the remaining bytes. An AIB for an 8-span line card has eight address elements and the value 0x00 for the remaining bytes. Data[0] Address Method (0x00, Single Entity) Data[1] Number of Address Elements (0x04, 0x08, 0x10, or 0x15; equal to number of spans) Address Element 1: Span 0 Data[2] Address Type (0x0C, Logical Span) Data[3] Data Length (0x02) Data[4] Logical Span ID, MSB Data[5] Logical Span ID, LSB Address Element N: Span N Data[...] Address Type (0x0C, Logical Span) Data[...] Data Length (0x02) Data[...] Logical Span ID, MSB Data[...] Logical Span ID, LSB

MFDSP and DSP-ONE Cards

The card information for the DSP-ONE cards indicates the function types for DSPs on all SIMMs on the card.

NOTE: For more information on function types, refer to the *DSP SIMM Configure* (0xC0) message.

<u>Byte</u>	<u>Function Type</u>
Data[0]	SIMM 0/DSP 0
Data[1]	SIMM 0/DSP 1
Data[2]	SIMM 0/DSP 2
Data[3]	SIMM 0/DSP 3
Data[4]	SIMM 1/DSP 0
Data[5]	SIMM 1/DSP 1
Data[6]	SIMM 1/DSP 2
Data[7]	SIMM 1/DSP 3
Data[8]	SIMM 2/DSP 0
Data[9]	SIMM 2/DSP 1
Data[10]	SIMM 2/DSP 2
Data[11]	SIMM 2/DSP 3
Data[12]	SIMM 3/DSP 0
Data[13]	SIMM 3/DSP 1
Data[14]	SIMM 3/DSP 2
Data[15]	SIMM 3/DSP 3
Data[16–33]	Reserved

DSP Series 2 Card

The card information for the DSP Series 2 Card indicates the function types for all DSPs on all Modules on the card, because each DSP can do multiple configurations.

<u>Byte</u>	<u>Function Type</u>
Data[0]	Module 0 / DSP 0 / RCV 0
Data[1]	Module 0 / DSP 0 / TXMT 0
Data[2]	Module 0 / DSP 0 / RCV 1
Data[3]	Module 0 / DSP 0 / TXMT 1
Data[4]	Module 0 / DSP 1 / RCV 0
Data[5]	Module 0 / DSP 1 / TXMT 0
Data[6]	Module 0 / DSP 1 / RCV 1
Data[7]	Module 0 / DSP 1 / TXMT 1
Data[8]	Module 0 / DSP 2 / RCV 0
Data[9]	Module 0 / DSP 2 / TXMT 0
Data[10]	Module 0 / DSP 2 / RCV 1
Data[11]	Module 0 / DSP 2 / TXMT 1
Data[12]	Module 0 / DSP 3 / RCV 0
Data[13]	Module 0 / DSP 3 / TXMT 0
Data[14]	Module 0 / DSP 3 / RCV 1
Data[15]	Module 0 / DSP 3 / TXMT 1
Data[16]	Module 1 / DSP 0 / RCV 0
Data[17]	Module 1 / DSP 0 / TXMT 0
Data[18]	Module 1 / DSP 0 / RCV 1
Data[19]	Module 1 / DSP 0 / TXMT 1
Data[20]	Module 1 / DSP 1 / RCV 0
Data[21]	Module 1 / DSP 1 / TXMT 0
Data[22]	Module 1 / DSP 1 / RCV 1
Data[23]	Module 1 / DSP 1 / TXMT 1
Data[24]	Module 1 / DSP 2 / RCV 0
Data[25]	Module 1 / DSP 2 / TXMT 0
Data[26]	Module 1 / DSP 2 / RCV 1
Data[27]	Module 1 / DSP 2 / TXMT 1
Data[28]	Module 1 / DSP 3 / RCV 0
Data[29]	Module 1 / DSP 3 / TXMT 0
Data[30]	Module 1 / DSP 3 / RCV 1
Data[31]	Module 1 / DSP 3 / TXMT 1
Data[32]	Reserved
Data[33]	Reserved

	EXNET-ONE This card generates no special information for this field. All bytes are 0x00. SS7 Card Data[0] Maximum Configurable Links for card Data[1] Slot Number of Active SS7 Card (see Note) Data[2] Slot Number of Secondary SS7 Card in Redundant Pair (see Note) Data[3] Stack ID Data[4] Stack ID Data[5] Stack ID Data[6] Stack ID Data[7–15]Reserved NOTE: Do not try to determine the redundancy status from bytes Data[1] and Data[2]. To determine the redundancy status, use the <i>CCS Redundancy Query</i> message. Redundant I/O and Standby I/O A Slot AIB indicates the slot number of the other I/O (Standby I/O or Redundant I/O) involved in a switchover. PCI H.100 Card The card information fields depend upon on H.100 bus clock speed and the number of spans per channel. 4MHz and 24 channels per span display 21 span entries 4MHz and 32 channels per span display 16 span entries 8MHz and 24 channels per span display 80 span entries 8MHz and 32 channels per span display 64 span entries
:	Hardware Configuration (16 bytes) This 16-byte field describes the hardware configuration of the card specified. This field applies to only the cards described below. DS3 Cards Data[0] Number of SS7 Spans Supported: 0x18 24 Spans 0x1C 28 Spans Data[1] DS3 Offset Framers Status Bit 0 - DS3 Offset 0 Framers Status 0 - Out of Service 1 - In Service (default) Bit [1-7] Reserved Data [2-13] Reserved Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1) Data[15] Total Available Spans

ST1LC and SE1LC cards	
Data[0]	Informs the host of primary and secondary loop timing clock sources configured on the card. Bits 0-2 If secondary loop timing is enabled, this field contains the offset of the span for which it is enabled. Bit 3 Secondary Loop timing 0 Disabled 1 Enabled Bit 4-6 If primary loop timing is enabled, this field contains the offset of the span for which it is enabled. Bit 7 Primary Loop timing 0 Disabled 1 Enabled
Data[1-15]	Reserved
T-ONE, E-ONE, J-ONE cards	
Data 0-3	Informs the host of primary and secondary loop timing clock sources configured on the card Data[0] Primary Loop Timing 0 Not Enabled 1 Enabled Data[1] If Primary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled. Data[2] Secondary Loop Timing 0 Not enabled 1 Enabled Data[3] If Secondary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled. Data[4-13] Reserved Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1) Data[15] Total Available Spans

MFDSP and DSP-ONE Card

This field informs the host of the number and types of DSP SIMMs installed on the card.

Data[0] Number of DSP SIMMs installed on the card

Data[1] Reserved

Data[2] SIMM 0 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[3] SIMM 1 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[4] SIMM 2 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[5] SIMM 3 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data 6-9: SIMM State 0 - SIMM State 3

0x00 In Service

0x01 Out of Service (or No SIMM Installed)

Data[6] SIMM 0 State

Data[7] SIMM 1 State

Data[8] SIMM 2 State

Data[9] SIMM 3 State

Data[10-15] Reserved

DSP Series 2 Card

This field informs the host of the number and types of DSP Modules installed on the card.

Data[0] Number of Modules installed on the card

Data[1] Reserved

Data[2] Module 0 Type

0x6C DSP 2 Module

0x03 No Module installed

Data[3] Module 1 Type

0x6C DSP 2 Module

0x03 No Module installed

Data[4, 5] Reserved

Data 6-13: DSP Chip States

0x00 In Service

0x01 Out of Service (or No Module Installed)

Data[6] Module 0 / Chip 0 State

Data[7] Module 0 / Chip 1 State

Data[8] Module 0 / Chip 2 State

Data[9] Module 0 / Chip 3 State

Data[10] Module 1 / Chip 0 State

Data[11] Module 1 / Chip 1 State

Data[12] Module 1 / Chip 2 State

Data[13] Module 1 / Chip 3 State

Data[14-15] Reserved

ISDN PRI Card

Data[0] Munich Chip Count

Data[1-15] Reserved

EXNET-ONE card

Data[0–3] Informs host of primary and secondary loop timing clock sources configured from ring timing on the card. For EXNET-ONE cards configured as a Single Ring Redundancy Standby, the Loop Timing fields are always disabled.

Data[0] Primary Loop Timing

0x00 Not Enabled

0x01 Enabled

Data[1] Reserved

Data[2] Secondary Loop Timing

0x00 Not Enabled

0x01 Enabled

Data[3] Reserved

SS7 cards

The system does not report hardware configuration information for these cards.

All bytes are 0x00.

SS7 Multi-Protocol I/O card

Data[0] Channel 0 Data Rate
0x00 64 Kbps
0x01 56 Kbps, for non-V.35 applications
0x80 V.35, 56 Kbps
0x81 48 Kbps, for non-V.35 applications
0xC0 V.35, 48 Kbps

Data[1] Channel 0 Electrical Interface
0x00 No Timing
0x01 V.35, DTE
0x02 V.35, DCE

Data[2] Channel 1 Data Rate (same possibilities as Channel 0, above)
Data[3] Channel 1 Electrical Interface (same possibilities as Channel 0, above)
Data[4] Channel 2 Data Rate (same possibilities as Channel 0, above)

Data[7] Module 2 state (0x05=ready, other values=not ready)

Data[8] Port Consumption Mode
1 Reserved
2 Port-Consuming

Data[9-15] Reserved (should be zero)

VDAC VoIP Module

Data[0] Total number of channels supported on the module
 Data[1] Number of channels supported for DSP 0
 Data[2] Number of channels supported for DSP 1
 Data[3] Number of channels supported for DSP 2
 Data[4] Number of channels supported for DSP 3
 Data[5] Number of channels supported for DSP 4
 Data[6] Number of channels supported for DSP 5
 Data[7] Number of channels supported for DSP 6
 Data[8] Number of channels supported for DSP 7
 Data[9-15]Reserved (should be zero)

IP Network Interface Series 2 card

Data[0] Number of VoIP Modules (0 - 2)
 Data[1] Number of channels supported (MSB)
 Data[2] Number of channels supported (LSB)
 Data[3] Installed VoIP Modules (Bit Field):
 Bit 0 VoIP Module 0 (0 = not installed, 1 = installed)
 Bit 1 VoIP Module 1 (0 = not installed, 1 = installed)
 Bit 2 VoIP Module 2 (0 = not installed, 1 = installed)

Note that for Data 4 - 6 each module can be in one of the following states:
 0x02 - Not Present, 0x05 - In Service, 0x06 - Out of Service, and 0x08 - Failed

Data[4] Module 0 State
 Data[5] Module 1 State
 Data[6] Module 2 State

Note that for Data 7 - 9 each module can be to one of the following IP resource profiles:

0x01 - G.711 Only (16 spans per module)
 0x02 - G.711 + G.723.1 + G.729 + T.38 (8 spans per module)
 0x0F - Not applicable (For example, module is not present)

Data[7] Module 0 Profile
 Data[8] Module 1 Profile
 Data[9] Module 2 Profile

Data[10] Port Consumption Mode
 1 = Non Port-Consuming
 2 = Port-Consuming

Data[11-15] Reserved (Set to 0)

IP Network Interface Series 2 card Module

Data[0] Total number of channels supported for the module (MSB)
 Data[1] Total number of channels supported for the module (LSB)
 Data[2] Module State
 Data[3] Module Profile
 Data[4] Bitmap of installed DSPs on a VoIP module (1 - Installed)
 Data[5] Bitmap of available DSPs on a VoIP module (1 - available)
 Data[6] Number of channels per available DSP
 Data[7] MII Bridge FPGA Version
 Data[8 - 15] Reserved (Set to 0)

Card Status Report 0x00A6

SwitchKit Name	CardStatusReport
Type	EXS API and SwitchKit API message
Description	This message reports information about a card's status. Because this message is defined differently for different card types, some fields listed below may not apply. This message is sent to the host when the host sends the <i>Card Status Query</i> message or when a card is reset.
Sent by	CSP
Resent in EXS API	This message is resent once after five (5) seconds.
Example Message for EXS API	The following example shows a trace of a <i>Card Status Report</i> message for a 4-span ST1LC card.

Header (bytes 0-9):

```
fe [00 51] [00 a6] 00 06 ff [00 00]
```

AIB (bytes 10-14):

```
00 01 01 01 01
```

Misc. Info. (bytes 15-27):

```
0c 12 0f 42 09 01 04 04 01 [02 16] [08 00]
```

Card Information (bytes 28-61):

```
00 08 / 0c 02 ff ff / 0c 02 ff ff / 0c 02 ff ff / 0c 02  
ff ff / 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
```

Hardware Configuration (bytes 62-77):

```
[00 00] 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
```

Misc. Info. (bytes 78-84):

```
0c 00 [00 00] 02 0e cs
```

SwitchKit Code C Structure

```

:	Card Status This field is a bit mask that applies to the following cards: Matrix Controller, T-ONE, E-ONE, J-ONE, DS3, EXNET-ONE, SS7-PQ, SS7 Series 3, DSP-ONE, MFDSP, DSP Series 2, ISDN PRI, ISDN Series 3, ST1LC, SE1LC, SJ1LC, VDAC-ONE, IP Network Interface Series 2, IP Signaling Series 3 Bit 0–1 Reset Reason 0 Cantata use only 1 Power-up 2 Cantata use only 3 Reset button pushed 2–3 Card State 0 In service 1 The CSP has taken the card out of service 2 The host has taken the card out of service 3 The host has put the card in a standby state 4 Invalid battery-backed configuration data. The host must reconfigure the card 5 Faults are logged Faults may be obtained using a <i>Fault Log Query</i> message. Obtain a Fault Log and report it to Cantata Technical Support as soon as possible. 6 Failed confidence tests. Information about the confidence test which failed is in the "Confidence Test Results" field. 7 General hardware failure The card is off-line and must be serviced. For the ISDN PRI card, see the Hardware Configuration Field for additional information.

	Fan Tray Bit 0 Reserved 1 Fan 6 failed 2 Fan 5 failed 3 Fan 4 failed 4 Fan 3 failed 5 Fan 2 failed 6 Fan 1 failed 7 General hardware failure. The card is off-line and must be serviced. Power Supply Card Bit 0 Module 3 failed 1 Module 3 in tolerance 2 Module 2 failed 3 Module 2 in tolerance 4 Module 1 failed 5 Module 1 in tolerance 6 Out of Tolerance 7 General hardware failure. The card is off-line and must be serviced. DS3, E1 and T1 Redundant and Standby I/O Cards Bit 0–5 Reserved 6 Output Enabled 7 Relays Enabled (0=Normal, 1=Switchover) Matrix I/O Card Bit 0 Interface B link state: 0=Down, 1=Up 1 Interface A link state: 0=Down, 1=Up 2 The active Ethernet Interface: 0=Interface A. 1=Interface B
:	Confidence Test Results This field is bit-defined. It applies to the Matrix Controller cards and line cards. Bit 0–5 Reserved 6 Bit set indicates RAM test failure 7 Bit set indicates ROM checksum failure
:	PC Artwork Revision An ASCII character in the range "A" to "Z" (0x41–0x5B) that indicates the revision level of the card's Printed Circuit Artwork.
:	Functional Revision The card's functional revision level
:	ROM Major Revision The major revision level of the firmware running on the card.
:	ROM Minor Revision The minor revision level of the firmware running on the card.
:	RAM Major Revision The major revision level of the system software running on the card.
:	RAM Minor Revision The minor revision level of the system software running on the card.

:	Serial Number MSB, LSB This two-byte field indicates the serial number of the card.
:	RAM Size MSB, LSB This two-byte field indicates the amount of RAM on the card, in 1K increments. For the VDAC VoIP Card and VDAC VoIP Module, RAM is measured in 1 MB increments.
:	Card Information (Field length varies) The card information, including the length of the field, varies per card type. The system uses the value 0x00 for fields that do not apply to the card or for all fields, if there is no card information. IP Signaling Series 3 Card No card specific or hardware specific information is sent for this card. T-ONE, E-ONE, J-ONE, DS3, ST1LC, SE1LC, VDAC-ONE, IP Network Interface Series 2, and SS7 Multi-Protocol cards The card information for these cards indicates the logical spans assigned to the card. The logical spans are indicated in the Logical Span AIB (0x0C) as shown below. The CSP uses the value 0xFF to indicate that no span has been assigned. An AIB for a 4-span line card has four address elements and the value 0x00 for the remaining bytes. An AIB for an 8-span line card has eight address elements and the value 0x00 for the remaining bytes. Data[0] Address Method (0x00, Single Entity) Data[1] Number of Address Elements (0x04, 0x08, 0x10, or 0x15; equal to number of spans) Address Element 1: Span 0 Data[2] Address Type (0x0C, Logical Span) Data[3] Data Length (0x02) Data[4] Logical Span ID, MSB Data[5] Logical Span ID, LSB Address Element N: Span N Data[...] Address Type (0x0C, Logical Span) Data[...] Data Length (0x02) Data[...] Logical Span ID, MSB Data[...] Logical Span ID, LSB

DSP Series 2 Card

The card information for the DSP Series 2 Card indicates the function types for all DSPs on all Modules on the card, because each DSP can do multiple configurations.

<u>Byte</u>	<u>Function Type</u>
Data[0]	Module 0 / DSP 0 / RCV 0
Data[1]	Module 0 / DSP 0 / TXMT 0
Data[2]	Module 0 / DSP 0 / RCV 1
Data[3]	Module 0 / DSP 0 / TXMT 1
Data[4]	Module 0 / DSP 1 / RCV 0
Data[5]	Module 0 / DSP 1 / TXMT 0
Data[6]	Module 0 / DSP 1 / RCV 1
Data[7]	Module 0 / DSP 1 / TXMT 1
Data[8]	Module 0 / DSP 2 / RCV 0
Data[9]	Module 0 / DSP 2 / TXMT 0
Data[10]	Module 0 / DSP 2 / RCV 1
Data[11]	Module 0 / DSP 2 / TXMT 1
Data[12]	Module 0 / DSP 3 / RCV 0
Data[13]	Module 0 / DSP 3 / TXMT 0
Data[14]	Module 0 / DSP 3 / RCV 1
Data[15]	Module 0 / DSP 3 / TXMT 1
Data[16]	Module 1 / DSP 0 / RCV 0
Data[17]	Module 1 / DSP 0 / TXMT 0
Data[18]	Module 1 / DSP 0 / RCV 1
Data[19]	Module 1 / DSP 0 / TXMT 1
Data[20]	Module 1 / DSP 1 / RCV 0
Data[21]	Module 1 / DSP 1 / TXMT 0
Data[22]	Module 1 / DSP 1 / RCV 1
Data[23]	Module 1 / DSP 1 / TXMT 1
Data[24]	Module 1 / DSP 2 / RCV 0

Data[27]	Module 1 / DSP 2 / TXMT 1
Data[28]	Module 1 / DSP 3 / RCV 0
Data[29]	Module 1 / DSP 3 / TXMT 0
Data[30]	Module 1 / DSP 3 / RCV 1
Data[31]	Module 1 / DSP 3 / TXMT 1
Data[32]	Reserved
Data[33]	Reserved

EXNET-ONE

This card generates no special information for this field. All bytes are 0x00.

SS7 Card

Data[0] Maximum Configurable Links for card
Data[1] Slot Number of Active SS7 Card (see Note)
Data[2] Slot Number of Secondary SS7 Card in Redundant Pair (see Note)
Data[3] Stack ID
Data[4] Stack ID
Data[5] Stack ID
Data[6] Stack ID
Data[7–15]Reserved

NOTE: Do not try to determine the redundancy status from bytes Data[1] and Data[2].
To determine the redundancy status, use the *CCS Redundancy Query* message.

Redundant I/O and Standby I/O

A Slot AIB indicates the slot number of the other I/O (Standby I/O or Redundant I/O)
involved in a switchover.

SS7 Multi-Protocol I/O Card

0x0C Logical Span AIB

PCI H.100 Card

The card information fields depend upon on H.100 bus clock speed and the number of spans per
channel.

4MHz and 24 channels per span display 21 span entries
4MHz and 32 channels per span display 16 span entries
8MHz and 24 channels per span display 80 span entries
8MHz and 32 channels per span display 64 span entries

:	Hardware Configuration (16 bytes) This 16-byte field describes the hardware configuration of the card specified. This field applies to only the cards described below. DS3 cards Data[0] Number of Spans Supported: 0x18 24 Spans 0x1C 28 Spans Data[1] DS3 Offset Framer Status Bit 0 - DS3 Offset 0 Framer Status 0 - Out of Service 1 - In Service (default) Bit [1-7] Reserved Data [2-13] Reserved Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1) Data[15] Total Available Spans ST1LC and SE1LC cards Data[0] Informs the host of primary and secondary loop timing clock sources configured on the card. Bits 0-2 If secondary loop timing is enabled, this field contains the offset of the span for which it is enabled. Bit 3 Secondary Loop timing 0 Disabled 1 Enabled Bit 4-6 If primary loop timing is enabled, this field contains the offset of the span for which it is enabled. Bit 7 Primary Loop timing 0 Disabled 1 Enabled Data[1-15] Reserved

T-ONE, E-ONE, J-ONE cards

Data 0–3 informs the host of primary and secondary loop timing clock sources configured on the card

Data[0] Primary Loop Timing

0 Not Enabled

1 Enabled

Data[1] If Primary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.

Data[2] Secondary Loop Timing

0 Not enabled

1 Enabled

Data[3] If Secondary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.

Data[4–13] Reserved

Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1)

Data[15] Total Available Spans

DSP Series 2 Card

This field informs the host of the number and types of DSP Modules installed on the card.

Data[0] Number of Modules installed on the card

Data[1] Reserved

Data[2] Module 0 Type

0x6C DSP 2 Module

0x03 No Module installed

Data[3] Module 1 Type

0x6C DSP 2 Module

0x03 No Module installed

Data[4, 5] Reserved

Data 6-13: DSP Chip States

0x00 In Service

0x01 Out of Service (or No Module Installed)

Data[6] Module 0 / Chip 0 State

Data[7] Module 0 / Chip 1 State

Data[8] Module 0 / Chip 2 State

Data[9] Module 0 / Chip 3 State

Data[10] Module 1 / Chip 0 State

Data[11] Module 1 / Chip 1 State

Data[12] Module 1 / Chip 2 State

Data[13] Module 1 / Chip 3 State

Data[14-15] Reserved

EXNET-ONE card

Data[0-3] Informs host of primary and secondary loop timing clock sources configured from ring timing on the card. For EXNET-ONE cards configured as a Single Ring Redundancy Standby, the Loop Timing fields are always disabled.

Data[0] Primary Loop Timing
 0x00 Not Enabled
 0x01 Enabled
 Data[1] Reserved
 Data[2] Secondary Loop Timing
 0x00 Not Enabled
 0x01 Enabled
 Data[3] Reserved

SS7 cards

The system does not report hardware configuration information for these cards.
 All bytes are 0x00.

SS7 Multi-Protocol I/O card

Data[0] Channel 0 Data Rate
 0x00 64 Kbps
 0x01 56 Kbps, for non-V.35 applications
 0x80 V.35, 56 Kbps
 0x81 48 Kbps, for non-V.35 applications
 0xC0 V.35, 48 Kbps

 Data[1] Channel 0 Electrical Interface
 0x00 V.35, DTE
 0x01 V.35, DCE

 Data[2] Channel 1 Data Rate (same possibilities as Channel 0, above)
 Data[3] Channel 1 Electrical Interface (same possibilities as Channel 0, above)

CCS Redundancy Configure 0x005B

SwitchKit Name CCSRedundancyConfig

Type EXS API and SwitchKit API message

Description This message configures a chassis for common channel signaling (CCS) redundancy. When the system is successfully configured, all configuration and call processing is mirrored on the secondary card. If the primary card fails, the secondary card resumes call processing where the primary left off. You enter the slot number of the primary and secondary SS7 or ISDN cards (using an AIB), and a configuration option to suspend synchronization or to not suspend synchronization.

Related Message *CCS Redundancy Report 0x0073* (CCSRedundancyReport)

CAUTION

Cantata strongly recommends sending this message during minimal call processing loads only. Replicating database and call processing information entails heavy processor bandwidth, which affects call processing performance and throughput.

Sent by Host

SwitchKit Code **Configuration**

```
CCSRedundancyConfig (
    Node = integer,
    PrimaryCard = integer,
    SecondaryCard = integer,
    RedundancyType = integer);
```

C Structure

```
typedef struct {
    UBYTE PrimaryCard;
    UBYTE SecondaryCard;
    UBYTE RedundancyType;
} XL_CCSRedundancyConfig;
```

C++ Class

```
class XLC_CCSRedundancyConfig : public
    XLC_OutboundMessage {
public:
    UBYTE getPrimaryCard() const;
    void setPrimaryCard(UBYTE x);

Channel Parameter Query 0x0080

SwitchKit Name ChannelParameterQuery

Type EXS API and SwitchKit API message

Description This message is used to query signaling timers and filters and configuration for Channel Associated Signaling (CAS) channels. The message response is formatted differently depending on the trunk type of the channel.

- PPL Format: E-ONE, T-ONE, SE1LC cards
- Non-PPL: T-ONE or ST1LC card using non-PPL format.

This message handles all DS3 functionality, including enabling and disabling loop back configuration and loop back queries. You must specify the slot number and the DS3 offset. You must take a DS3 span out of service before you can place it into remote loop back.

Do not use this message for Common Channel Signaling (CCS) channels. For ISDN, use the *B Channel Query* message. For SS7, use the *SS7 CIC Query* message.

NOTE: The message format to query PPL channels includes a Response Format field. For backward compatibility, if no value is present, the response will be in non-PPL format.

Sent by Host

SwitchKit Code **C Structure**

```
typedef struct {
    unsigned short Span;
    UBYTE Channel;
} XL_ChannelParameterQuery;
```

C Structure Response

```
typedef struct {
    unsigned short Status;
    UBYTE TrunkType;
    UBYTE Data[235];
} XL_ChannelParameterQueryAck;
```

C++ Class

```
class XLC_ChannelParameterQuery : public
    XLC_OneChannelOutbound {
public:
    unsigned short getSpan() const;
    void setSpan(unsigned short x);
    UBYTE getChannel() const;
    void setChannel(UBYTE x);
};
```

C++ Class Response

```

class XLC_ChannelParameterQueryAck : public
    XLC_AcknowledgeMessage {
public:
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    UBYTE getTrunkType() const;
    void setTrunkType(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};

```

Channel Release Request 0x0037

SwitchKit Name	ChannelReleaseRequest
Type	EXS API and SwitchKit API message
Description	The conditions in which the CSP uses this message depends on the protocol you are using.
SS7	An SS7 channel reports this message to the host if both of the following conditions exist: • The SS7 channel is connected to a channel that is released • The release modes for the channels call for the SS7 channel to be released This lets the host insert parameters for the outgoing ISUP REL using the <i>Release Channel With Data</i> message. If no data is to be inserted, the host may use the <i>Release Channel</i> message.
ISDN	The CSP sends this message to the host upon a network-initiated <i>ISDN Disconnect</i> message if the ISUP mode configuration is set to allow release upon a disconnect. The host responds with either a <i>Release Channel</i> message or a <i>Release Channel With Data</i> message to send information to the ISDN with the release.
Sent by	CSP

SwitchKit Code C Structure

Channel Released 0x0049

SwitchKit Name ChannelReleased

Type EXS API and SwitchKit API message

Description: This message informs the host that a channel has been released, is in an idle state, and is ready for incoming or outgoing calls.

Sent by: CSP

Resent in EXS API This message is resent once after five seconds.

SwitchKit Code **C Structure:**

```
typedef struct {
    unsigned short Span;
    UBYTE Channel;
} XL_ChannelReleased;
```

C++ Class:

```
class XLC_ChannelReleased : public XLC_OneChannelMessage
{
public:
    unsigned short getSpan() const;
    void setSpan(unsigned short x);
    UBYTE getChannel() const;
    void setChannel(UBYTE x);
};

Channel Released With Data 0x0069

SwitchKit Name ChannelReleasedWithData

Type EXS API and SwitchKit API message

Description This message indicates that the network has initiated a release with associated data. If no parameter data is associated with the call release, then a *Channel Released* (0x49) message is sent instead.

For a VoIP call, a Release TLV will appear in the message in the Extended ICB. For SS7 TUP, Release parameters are included in a BT IUP parameters ICB. When BT IUP is configured, then a BT IUP ICB with a release TLV may be present.

For SwitchKit Only When an ICBType field is set to 0x03, use the following methods for extracting the data of the fields shown in the following table.

If the field is...	then the method for extracting the data is...
ICBSubType	sk_extractExtendedICBFromChannelReleasedWithData()
ICBLength	sk_extractExtendedICBFromChannelReleasedWithData()
ICBData	sk_extractExtendedICBFromChannelReleasedWithData()
getICBSubType()	getExtendedICBSubtype()
getICBLength()	getExtendedICBLength()
getICBData()	getExtendedICBData()

Sent by CSP

Resent in EXS API This message is resent once after five seconds.

Example Message (Log Output in SwitchKit) The following socket log output/example message is an H.323 call, that the network has initiated a release with a Release TLV indicating Invalid Permission Chosen, Facility Call Deflection.

ChannelGroupContentsQuery

Type: EXS SwitchKit API message

Description Use the *SK_ChannelGroupContentsQuery* to query the contents of the channel group by name. The acknowledgment *SK_ChannelGroupContentsQueryAck* contains the number of channels in that group as well as all the spans and channels.

To process all these channels, you use the following code:

```
SK_MSG_SWITCH(msg) {
    CASE_ChannelGroupContentsQueryAck(ack) {
        int i;
        UBYTE *dta = ack->Channels;
        for (i=0;i<ack->NumChannels;i++)
        {
            short span = ntohs(*(short *)dta);
            int chan = (int)dta[2];
            processChannel(span,chan);
            dta += 3;
        }
    }
} SK_END_SWITCH;
```

The format of the Channels data structure is two bytes for the span in network byte order, followed by one byte representing the channel offset.

Sent by Application

C Structure

```
typedef struct {
    char GroupName[50];
    UBYTE reserved67[23];
} SK_ChannelGroupContentsQuery;
```

C Structure Response

```
typedef struct {
    int Status;
    int NumChannels;
    UBYTE Channels[245];
} SK_ChannelGroupContentsQueryAck;
```

C++ Class

```
class SKC_ChannelGroupContentsQuery : public
    SKC_ToolkitMessage {
public:
    const char *getGroupName() const;
    void setGroupName(const char *x);
};
```

C++ Class Response

```
class SKC_ChannelGroupContentsQueryAck : public
    SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
    int getNumChannels() const;
    void setNumChannels(int x);
    const UBYTE *getChannels() const;
    UBYTE *getChannels();
    void setChannels(UBYTE *x);
};
```

Status Field Return Values

The possible status values are:

OK

Query successful acknowledged.

SK_INVALID_GROUP

The GroupName in the query does not exist.

Arguments

GroupName: Name of Group to be queried.

ChannelGroupPopulationQuery

Type:	EXS SwitchKit API message
Description	Use the <i>SK_ChannelGroupPopulationQuery</i> message to query the existing defined channel groups on the LLC. The GroupNames field contains a set of group names, each separated by the NULL character. For example, to loop over all the groups, as returned by this message, you could use the following code: <pre>SK_MSG_SWITCH(msg) { CASE_ChannelGroupPopulationQueryAck(ack) { int i; char *gps = (char *)ack->GroupNames; for (i=0;i<ack->NumGroups;i++) { char *aGroup = gps; processGroup(aGroup); gps += strlen(gps) + 1; } } } SK_END_SWITCH;</pre>
Sent by	Application
C Structure	<pre>typedef struct { } SK_ChannelGroupPopulationQuery;</pre>
C Structure Response	<pre>typedef struct { int Status; int NumGroups; UBYTE GroupNames[245]; } SK_ChannelGroupPopulationQueryAck;</pre>
C++ Class	<pre>class SKC_ChannelGroupPopulationQuery : public SKC_ToolkitMessage { public: };</pre>
C++ Class Response	<pre>class SKC_ChannelGroupPopulationQueryAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); int getNumGroups() const; void setNumGroups(int x); const UBYTE *getGroupNames() const; UBYTE *getGroupNames(); void setGroupNames(UBYTE *x); };</pre>

Return Status Always 0x10

ChannelProblem

Type:	EXS SwitchKit API message
Description	This message is generated by SwitchManager. To do this, SwitchManager must be running in order for an application to receive a channel problem message. An application can receive a message when a channel has encountered some problems, but has not gone out-of-service. The application also receives this message when the problem clears. ErrorNum equals one (1) if a red or yellow span alarm occurs; or equals two (2) if a PPL Event Indication occurs. The LLC does not allocate a channel that is in an alarm state, but if an application already has a channel that has entered into an alarm state, the application must deal with this state. Text will contain a description of the problem, which in the case of red and yellow alarms is a description of the current network status. A problem with a value of one (1) means the problem just occurred; a value of zero (0) means the problem has cleared. In the case of a span alarm, Data1 will equal the status field extracted from the EXS API message. In the case of a PPL Event Indication, Data1 will equal the PPL Event.
Sent by	SwitchManager; forwarded by LLC
C Structure	<pre>typedef struct { unsigned short Span; UBYTE Channel; UBYTE Problem; UBYTE ErrorNum; UBYTE Data1; UBYTE Data2; char Text[200]; } SK_ChannelProblem;</pre>

const char *getText() const;  
void setText(const char *x);  
};
```

Clear System Software 0x000C

SwitchKit Name	ClearSystemSoftware
Type	EXS API and SwitchKit API message
Description	NOTE: This message is for use in a lab environment only. You must not send this message to a live system. This message clears the system software stored in memory on the Matrix Controller card. Use this message immediately before you send a new load to the Matrix Controller card. To stop the running system software, push the Reset button or send a <i>Reset Matrix</i> message. System software is copied into maintained storage. Upon reset or boot, software is copied from maintained storage to RAM for execution. When the host sends this message, the copy in maintained storage is cleared, but the RAM is unaffected. If a card resets after you send this message, the card will not retrieve a software load from maintained storage and will not come back into service. Redundant Matrix Cards In a redundant system, sending this message to the active Matrix Controller card clears both Matrix Controller cards. After sending this message to the active Matrix Controller card, you must send a <i>Reset Matrix</i> message to both Matrix Controller cards.
Sent by	Host
Related API Message	<i>Reset Matrix</i> 0x009D (ResetMatrix)
SwitchKit Code	C Structure <pre>typedef struct { } XL_ClearSystemSoftware;</pre> C++ Class <pre>class XLC_ClearSystemSoftware : public XLC_OutboundMessage { public: };</pre>

EXS API Hex Format

MESSAGE (White)		RESPONSE (Gray)

6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
8	Checksum	8, 9	Status (MSB, LSB)
		10	Checksum

ClearAllChanGroups

Type:	EXS SwitchKit API message
Description	Use the <i>SK_ClearAllChanGroups</i> message to remove all channel groups.
Sent by	SwitchManager
Configuration	<i>ClearAllChanGroups()</i> ;
C Structure	<pre>typedef struct { } <i>SK_ClearAllChanGroups</i>;</pre>
C++ Class	<pre>class <i>SKC_ClearAllChanGroups</i> : public SKC_AdminMessage{ public: };</pre>

ClearChanGroup

Type:	SwitchKit API message
Description	Use the <i>SK_ClearChanGroup</i> message to remove all channels from a channel group. Because channel group bindings accumulate for as long as the LLC is running, it is recommended that you clear every channel group that you use in a configuration file.
Sent by	SwitchManager
Configuration	<i>ClearChanGroup</i> (ChannelGroup = string);
C Structure	<pre>typedef struct { char ChannelGroup[45]; } <i>SK_ClearChanGroup</i>;</pre>
C++ Class	<pre>class <i>SKC_ClearChanGroup</i> : public SKC_AdminMessage { public: const char *getChannelGroup() const; void setChannelGroup(const char *x); };</pre>

ClearLog

Type SwitchKit API message

Description The ***ClearLog*** message is used as an operations, administration and maintenance feature in the Converged Services Administrator (CSA) to clear log files. You can choose among different options to clear log files.

Sent by Application or CSA

How to use To use a ***ClearLog*** message, construct the message and set the LoggingBitMask:

```
SKC_ClearLog cl;  
UBYTE log_bit_mask = SK_CLEAR_MSG_LOG |  
                     SK_CLEAR_SOCKET_LOG  
cl.setLoggingBitMask(log_bit_mask);
```

Argument Values The following table shows the common values of the LoggingBitMask argument. You can combine two or more values with a logical OR to clear several logs at once.

Clear individual log files using the following values:

Argument Value	Description
SK_CLEAR_MSG_LOG	Clears only the messages log file.
SK_CLEAR_MAINT_LLC_LOG	Clears only the LLC maintenance log.
SK_CLEAR_SOCKET_LOG	Clears only the socket log file.
SK_CLEAR_ALARM_LOG	Clears only the alarm log file.
SK_CLEAR_MAINT_SWMGR_LOG	Clears only the SwitchManager maintenance log file.

Clear groups of log files using the following values:

Argument Value	Description
SK_CLEAR_ALL_SK_LOGS	Clears all the SwitchKit logs.
SK_CLEAR_ALL_LLC_LOGS	Clears all LLC logs, including: SK_CLEAR_MSG_LOG SK_CLEAR_MAINT_LLC_LOG SK_CLEAR_SOCKET_LOG

SK_CLEAR_ALL_SWMGR_LOGS	Clears all SwitchManager logs, including: SK_CLEAR_ALARM_LOG SK_CLEAR_MAINT_SWMGR_LOG

C Structure typedef struct {
 UBYTE LoggingBitMask;
 } ***SK_ClearLog***;

C Structure Response typedef struct {
 int Status;
 } ***SK_ClearLogAck***;

C++ Class class ***SKC_ClearLog*** : public SKC_ToolkitMessage {
public:
 UBYTE getLoggingBitMask() const;
 void setLoggingBitMask(UBYTE x);
};

C++ Class Response class ***SKC_ClearLogAck*** : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
};

Clear IP Signaling Series 3 Card 0x0108

Type EXS API message

Description This message clears the system software on the IP Signaling Series 3 card before and/or after the IP Signaling Series 3 card interface is established. This message is sent directly to the IP Signaling Series 3 card and uses the extended logical node ID format.

To initiate the download of the new software load, you need to reset the IP Signaling Series 3 card by pushing the Reset button or using the *Reset IP Signaling Series 3 Card* message (0x0107).

Sent by Host

Example Message The following clears the system software on the IP Signaling Series 3 card when the IP Signaling Series 3 card ID or Matrix ID is not assigned.

00 11 01 08 00 00 fe 00 02 52 02 ff ff 53 04 00 20 ff ff

ClearSoftware

- Type:** SwitchKit API message
- Purpose** Use the ***ClearSoftware*** message to clear system software and to reset the matrix controller or device server of the CSP.
- Description** This message is used for clearing system software and for resetting the the matrix controller card(s).
- Sent by** Application or CSA
- How to use** To use a ***ClearSoftware*** message, construct the message and set the matrix and action arguments as shown below:
- ```
SKC_ClearSoftware cls();
cls.setMatrix(matrix);
cls.setAction(action);
cls.setNodeId(node);
```
- Arguments** The following table shows the arguments you can change:

| Arguments | Description                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Matrix    | <p>This argument specifies on which matrix controller card the action is applied:</p> <p>SK_CLEARSW_ACTIVE (1) = Apply action to active matrix controller</p> <p>SK_CLEARSW_STANDBY (2) = Apply action to standby matrix controller</p> <p>SK_CLEARSW_ALL (3) = Apply action on both matrix controller cards in the CSP</p> |
| Action    | <p>This argument specifies which action is applied:</p> <p>SK_CLEARSW_CLEAR (1) = Clear software but do not reset the matrix controller.</p> <p>SK_CLEARSW_CLEAR_AND_RESET (2) = Clear software and reset the matrix controller.</p>                                                                                        |

| Arguments | Description                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node      | This argument specifies the logical node ID of the matrix controller pair or the Device Server ID of the Device Server card to which the action is to be applied. |

**Status Field** The following table shows the possible return values of the status field. The status field can contain any of the values or the logical OR combination of two or more of the following:

| Value                           | Description                                                                     |
|---------------------------------|---------------------------------------------------------------------------------|
| SK_SUCCESS (0x10)               | Message successfully executed.                                                  |
| SK_ACTIVE_NOT_CLEARED (0x0001)  | The active matrix controller card was not cleared.                              |
| SK_STANDBY_NOT_CLEARED (0x0002) | The standby matrix controller card was not cleared.                             |
| SK_ACTIVE_NOT_RESET (0x0004)    | The active matrix controller card was not reset.                                |
| SK_STANDBY_NOT_RESET (0x0008)   | The standby matrix controller card was not reset.                               |
| SK_INVALID_NODE (0xf002)        | This indicates that the application has no description data associated with it. |

```

## Collect Digit String 0x00BC

---

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <b>SwitchKit Name</b> | CollectDigitString                                                                  |
| <b>Type</b>           | EXS API and SwitchKit API message                                                   |
| <b>Description</b>    | This message instructs the CSP to attach a digit receiver to the specified channel. |

**NOTE:** The digit receiver collects digit strings only if the digits are either DTMF or MFR1, or if the call is in a state other than idle, out of service, or busied out

Once the receiver has collected the digits, the CSP sends a *Call Processing Event* message with the value 0x02 (Digits) in the *Call Processing Event* field. If an error occurs, the CSP sends a *Call Processing Event* message and indicates the error using the *Status* field.

If the host sends this message and specifies a channel to which a digit receiver is already attached, the CSP sends the host a response with a status of 0x30 (DSP Resource Already Allocated). The channel is not affected.

The CSP releases the digit receiver from the channel when one of the following occurs:

- The CSP sends a *Call Processing Event* message
- The call is released
- The CSP receives a *DSP Service Cancel* message from the host

**Sent by** Host Application

**SwitchKit Code** **C Structure**

| <b>Entity Options</b> | <p><b>Entity</b></p> <p>0 - Allocation Pattern</p> <p>Controls the order in which LLC will allocate the channels when you request a channel in a channel group.</p>                                                                                                                  |

## Parameters for Allocation Pattern

| Value     | Allocator   | Description                                                                                                                                                      |
|-----------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 default | Round Robin | Begins with the first available channel, and proceeds through the group, always choosing the next available channel starting from the channel it last allocated. |
| 1         | Ascending   | Always chooses the first (i.e., lowest numbered) available channel in the group.                                                                                 |

| <b>Value</b> | <b>Allocator</b>          | <b>Description</b>                                                         |
|--------------|---------------------------|----------------------------------------------------------------------------|
| 2            | Descending                | Chooses the last (highest numbered) available channel in the group.        |
| 3            | LRU (Least Recently Used) | Chooses the channel that has been in the idle state for the longest time.  |
| 4            | MRU (Most Recently Used)  | Chooses the channel that has been in the idle state for the shortest time. |

**Example**    *ConfigChanGroup* (  
                  ChannelGroup = “outbound”,  
                  Entity = 0,  
                  Parameter = 1);

# ConfigStatusMsg

---

**Type:** SwitchKit API message

**Purpose** SwitchManager sends the ***SK\_ConfigStatusMsg*** message to a registered application at configuration time.

An application can register to receive this message when SwitchManager configures the entire CSP or a part of an CSP configuration, including start-up, a dynamic change request, or a matrix failure. SwitchManager tracks when the configuration begins, when it ends, and the number of positive and negative ACKs received.

To receive the message *SK\_ConfigStatusMsg*, your application must register for this message using the **sk\_msgRegister()** function. The application should not send an acknowledgement for this message.

If SwitchManager is run with -s option and if there was no configuration message sent to the CSP, SwitchManager will not send any ***SK\_ConfigStatusMsg***.

**Sent by** SwitchManager

**C Structure**

```
typedef struct {
 UBYTE Event;
 UBYTE ConfigType;
 int NumMsgsSent;
 int NumMsgsNacked;
} SK_ConfigStatusMsg;
```

**C++ Class**

```
class SKC_ConfigStatusMsg : public SKC_ToolkitMessage {
public:
 UBYTE getEvent() const;
 void setEvent(UBYTE x);
 UBYTE getConfigType() const;
 void setConfigType(UBYTE x);
 int getNumMsgsSent() const;
 void setNumMsgsSent(int x);
 int getNumMsgsNacked() const;
 void setNumMsgsNacked(int x);
};
```

**Field Values** The following table shows the possible field values of this message:

| Field         | Values and Description                                                                                                                                                                                                                                                                                                                                          |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event         | <ul style="list-style-type: none"> <li>• SK_BEGIN_CONFIG = indicates SwitchManager began a configuration.</li> <li>• SK_END_CONFIG = indicates SwitchManager finished the configuration.</li> <li>• SK_PARSE_ERROR = indicates an error occurred when parsing the configuration.</li> </ul>                                                                     |
| ConfigType    | <p>This field indicates the reason the configuration takes place. Possible reasons are:</p> <p>SK_INITIAL_CONFIG<br/> SK_DYNAMIC_CONFIG<br/> SK_MATRIX_STATE<br/> SK_RECEIPT_OF_NSR<br/> SK_CONFIG_TAG_RESET<br/> SK_CARD_RECONFIG<br/> SK_CARD_FAILURE</p>                                                                                                     |
| NumMsgsSent   | This field indicates the number of messages sent to the CSP through SwitchManager.                                                                                                                                                                                                                                                                              |
| NumMsgsNacked | This field indicates the number of messages that have been negatively acknowledged by the CSP. If a config message gets a nack with status “No Ack From Switch” or “Card Not ready for configuration”, SwitchManager will try to re-send the config message several times before quitting. This would be reflected on the NumMsgsSent and NumMsgsNacked fields. |
| Slot          | SK_CARD_FAILURE<br>SK_CARD_RECONFIG<br>SK_CONFIG_TAG_RESET                                                                                                                                                                                                                                                                                                      |
| CardType      | SK_CARD_FAILURE<br>SK_CARD_RECONFIG<br>SK_CONFIG_TAG_RESET                                                                                                                                                                                                                                                                                                      |

#### Relevant Attributes to ConfigType

| ConfigType        | Attributes |
|-------------------|------------|
| SK_MATRIX_STATE   | Node       |
| SK_DYNAMIC_CONFIG | Nothing    |

|                     |                      |

| SK_RECEIPT_OF_NSR   | Node                 |
| SK_CARD_FAILURE     | Node, Slot, CardType |
| SK_CARD_RECONFIG    | Node, Slot, CardType |
| SK_CONFIG_TAG_RESET | Node, Slot, CardType |

# ConfigSwitch

---

**Type:** SwitchKit API message

**Purpose** Use the ***SK\_ConfigSwitch*** message to dynamically configure the switch without sending a configuration file.

**Description** ***SK\_ConfigSwitch*** uses the bytes of the message as parameters. The acknowledgement ***SK\_ConfigSwitchAck*** contains a status value from SwitchKit and a status value from the switch.

**How to use SK\_ConfigSwitch** You have to declare a C Structure to contain a configuration that will be sent to the switch. Use the function ***sk\_packMessage***(MsgStruct \*m, char \*data, int \*NumBytes) to find out the fields NumBytes and Data. Send the message to the LLC using its member function send(). Wait for an acknowledgment, the status fields give information about the configuration message.

When you send the ***SK\_ConfigSwitch*** message, SwitchManager extracts it using the function ***sk\_unpackMessage***() and sends the extracted information to the switch. Before SwitchManager can send an acknowledgment, it must wait until the switch processes the configuration. During this time, it is not possible to send another ***SK\_ConfigSwitch*** message to the switch. If another ***SK\_ConfigSwitch*** message is sent before receiving an acknowledgment, SwitchManager will NACK the second message. The SKStatus field will indicate this with SK\_NOT\_READY.

**Sent by** CSA or Application

**Field Values** The following table shows the possible field values for this message:

| Field   | Values and Description                                                                                                                                                                                                                                                   |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | <ul style="list-style-type: none"> <li>0 = Do not send or process the message yet, there are more to come. SwitchManager stores the message in a TEMP collection.</li> <li>1 = Send this message and all the messages previously added using Action set to 0.</li> </ul> |
| Offline | <ul style="list-style-type: none"> <li>0 = Process and send the message.</li> <li>1 = Process the message but do not send it.</li> </ul>                                                                                                                                 |

**C Structure**

```
typedef struct {
 UBYTE Target;
 UBYTE Type;
 UBYTE MsgFormat;
 UBYTE Action;
 UBYTE Offline;
 int Tag1;
 int Tag2;
 char AppGroupTarget[32];
 int DataSize;
 UBYTE Data[204];
} SK_ConfigSwitch;
```

**C Structure Response**

```
typedef struct {
 int Status;
 int XLStatus;
} SK_ConfigSwitchAck;
```

**C++ Class**

```
class SKC_ConfigSwitch : public SKC_ToolkitMessage {
public:
 UBYTE getTarget() const;
 void setTarget(UBYTE x);

| <b>Description</b>                                               | <p><b>NOTE:</b> If you are using the DSP Series 2 card, use the <i>Resource Create 0x0124</i> message to create a conference.</p> <p>Use this message to create a multi-channel conference on the MFDS or DSP-ONE card. A DSP configured for conferencing may have more than one conference created on it, in any combination of the maximum allowed channels.</p> <p>Use the Conference ID returned by the CSP for any further references to the conference. The CSP assigns Conference IDs in descending order as they are created.</p> <p>You receive a NACK of 0x2D (Incompatible PCM Encoding for Conference) if a channel from a remote node tries to connect 1-Way to a conference and the encoding type does not match the broadcast type set during the conference creation.</p> <p>You cannot use the following Conference Types with the DSP Series 2 card:</p> <ul style="list-style-type: none"><li>• A-law Standard</li><li>• <math>\mu</math>-law Standard</li><li>• Mixed</li></ul> |       |                |       |              |    |          |    |                 |    |                               |    |                               |    |                                                |    |                                      |

The following example is for any channel, any DSP, Unified Dynamic, u-law conference of 25 channels, with broadcast enabled:

```

00 08 Message Length
00 4B Message Type
00 Reserved
00 Sequence Number
FF Logical Node ID (Single Node)
19 Conference Size (25 channels)
27 Conference Type
 (Any channel, Any DSP, Unified Dynamic, u-law)
01 Broadcast Enable (Broadcast Enabled)

```

## SwitchKit Code    C Structure

```

typedef struct {
 UBYTE ConferenceSize;
 UBYTE ConferenceType;
 UBYTE BroadcastEnable;
} XL_ConferenceCreate;

```

## C Structure Response

```

typedef struct {
 unsigned short Status;
 unsigned short ConferenceID;
} XL_ConferenceCreateAck;

```

## C++ Class

```

class XLC_ConferenceCreate : public XLC_OutboundMessage {
public:
 UBYTE getConferenceSize() const;
 void setConferenceSize(UBYTE x);
 UBYTE getConferenceType() const;
 void setConferenceType(UBYTE x);
 UBYTE getBroadcastEnable() const;
 void setBroadcastEnable(UBYTE x);
};

```

## C++ Class Response

```

class XLC_ConferenceCreateAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};

```

**EXS API Hex Format**

| <b>Description</b>    | <p><b>NOTE:</b> If you are using the DSP Series 2 card, use the <i>Resource Delete 0x0126</i> message to delete a conference.</p> <p>Use this message to delete a conference on the MFDSP or DSP-ONE card. A response <i>Status</i> value of positive acknowledgment (0x0010) indicates that conference deletion has been “initiated” by the CSP. When deletion is complete, the CSP will send a <i>Conference Deleted</i> message to the host. To delete all conferences, specify 0xFFFF in the <i>Conference ID</i> field.</p>                                                                                                                                                                                                                                                                                                                                                          |

## Conference Deleted 0x004D

---

**SwitchKit Name** ConferenceDeleted

**Type** EXS API and SwitchKit API message

**Description** **NOTE:** If you are using the DSP Series 2 card, you will receive a *Resource Delete Indication 0x0129* message to indicate a conference has been deleted. This message is sent to the host after a conference on an MFDSP or DSP-ONE card is deleted (for example, all channels in the conference are released and the DSP resource is freed up).

**Sent by** CSP

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short ConferenceID;
} XL_ConferenceDeleted;
```

**C++ Class**

```
class XLC_ConferenceDeleted : public XLC_InboundMessage {
public:
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

**Resent in EXS API** This message is resent once after five seconds.

### EXS API Hex Format

| MESSAGE (White) |                       | RESPONSE (Gray) |                       |
|-----------------|-----------------------|-----------------|-----------------------|
| Byte            | Field Description     | Byte            | Field Description     |
| 0               | Frame (0xFE)          | 0               | Frame (0xFE)          |
| 1, 2            | Length (0x0007)       | 1, 2            | Length (0x0005)       |

| 5               | Reserved (0x00)       | 5               | Reserved (0x00)       |
| 6               | Sequence Number       | 6               | Same Sequence Number  |
| 7               | Logical Node ID       | 7               | Logical Node ID       |
| 8, 9            | Conference ID         | 8               | Checksum              |
| 10              | Checksum              |                 |                       |

## Connect 0x0000

---

**SwitchKit Name** Connect

**Type** EXS API and SwitchKit API message

**Description** This message instructs the CSP to establish a two-way connection between the two channels specified, for example, Channel A and Channel B.  
If there is no active call up for Channel B, a seizure will be generated on that channel, and once seize ACKs have been met, the voice path is connected.

**NOTE:** This message treats the first span/channel and the second span/channel the same regardless of their inbound or outbound nature. Therefore, the answer supervision mode of only the second span/channel is meaningful in the *Connect* API message.

**Sent by** Host

**Example Message (Socket Log Output for SwitchKit)**

For EXS API, the example message below configures the CSP to establish a two-way connection between span 01 channel 01 and span 02 channel 02:  
For SwitchKit, the socket log output below shows configuration of the CSP, which establishes a two-way connection between span 01 channel 01 and span 02 channel 02:

00 11 00 00 00 00 FF 00 02 0D 03 00 01 01 0D 03 00 02 02

**SwitchKit Code C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
} XL_Connect;
```

**C++ Class**

```
class XLC_Connect : public XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
 void setChannelB(UBYTE x);
};
```

**EXS API Hex Format**

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 unsigned short ConferenceID;
} XL_ConnectOneWayToConference;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectOneWayToConferenceAck;
```

### C++ Class

```
class XLC_ConnectOneWayToConference : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

### C++ Class Response

```
class XLC_ConnectOneWayToConferenceAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
```

```

UBYTE getChannel() const;
void setChannel(UBYTE x);
};

```

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 unsigned short ConferenceID;
} XL_ConnectToConference;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectToConferenceAck;
```

### C++ Class

```
class XLC_ConnectToConferenceAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

### C++ Class Response

```
class XLC_ConnectToConference : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
```

};

## Connect One-Way Forced 0x0050

---

**SwitchKit Name**     ConnectOneWayForced

**Type**     EXS API and SwitchKit API message

**Description**     This message establishes a one-way connection between two channels, where Channel A is the source channel (talk only) and Channel B is the destination channel (listen only).

With this connection, the CSP does not do any checking on the state of Channel A; it can be in any state. This lessens the degree of call processing required, resulting in a significantly faster call rate. Channel B, however, must be in an acceptable connection state.

The connection will only be torn down if Channel B is released by the host, or as a result of a network-initiated release.

When performing a “Connect One-Way Forced A-to-B” on a multi-node system, you must send this message to the node containing the “B” channel.

**NOTE:**     While this API message can be used during call flow, the one-way connection will not be maintained through a Matrix Controller switchover.

For SwitchKit: If you use the ConnectOneWayForced message in your call control application, you need to specify which node you want the message to be sent to. You can specify the node within the C Structure field BaseFields Base (NodeID) or within in the C++ Class through inheritance from SKC\_Message (getNode, setNode).

**Sent by**     Host

**SwitchKit Code**     **C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
 UBYTE BPad;
} XL_ConnectOneWayForced;
```

### C++ Class

```
class XLC_ConnectOneWayForced : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
```

```

UBYTE getChannelB() const;
void setChannelB(UBYTE x);
UBYTE getBPad() const;
void setBPad(UBYTE x);
};

```

**EXS API Hex Format**

| <b>Description</b>    | <p>This message instructs the CSP to transmit a call progress pattern ID to the specified channel. The channel must be in any state other than: idle, out of service, or busied out.</p> <p>If you want to be notified with a <i>Call Processing Event</i> message (0x21 - Tone Complete) when tone transmission has stopped, set the <i>Generate Event Flag</i>.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>    | <p>This message instructs the CSP to suspend the processing of an incoming call on a channel. This message may be used by the host as a response to the <i>Request for Service</i> message sent by the CSP.</p> <p>The CSP stops resending the <i>Request for Service</i> message for the channel and waits for a connection management message such as <i>Park Channel</i>, <i>Connect</i>, and so on.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                        |

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectWait;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectWaitAck;
```

### C++ Class

```
class XLC_ConnectWait : public XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
};
```

### C++ Class Response

```
class XLC_ConnectWaitAck : public XLC_AcknowledgeMessage
{
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

| <b>SwitchKit Name</b>              | ConnectWithData                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Type</b>                        | EXS API and SwitchKit API message                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>                 | <p>This message instructs the CSP to connect two channels.</p> <p>This message also supports canceling digit collection, playing of call progress tones, voice path connect functionality, and dynamic configuration of release modes.</p>                                                                                                                                          |
| <b>ISDN</b>                        | If the terminating channel is not in an idle state, after seizure the alerting and connect indications will get propagated to the incoming side and the data specified in this message will get sent to the incoming ISDN channel.                                                                                                                                                  |
| <b>SS7</b>                         | You can use this message to pass parameter data for the ACM, ANM, or CON (ITU-TS only) in a connection between an incoming SS7 call (A Party) and another channel.                                                                                                                                                                                                                  |
| <b>SIP (Call Agent)</b>            | The message carries the B side SDP (Session Description Protocol) information to the CSP in an NPDI Universal ICB and Generic PPL ICB. In a Generic PPL ICB, the Channel Service TLV indicates whether a bearer-switched or bearer-free connection is requested. For a bearer-free connection, the B side connection information is passed in the NPDI Universal ICB from the host. |
| <b>Sent by</b>                     | Host                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Example Message for EXS API</b> | <p>The following example message uses the Release Mode Configure ICB in a <i>Connect With Data</i> message to park Channel A (Span 0, Channel 0) and release Channel B (Span 0, Channel 1).</p> <pre>00 0D 00 05 00 00 FF 01 02 0D 03 00 00 00 0D 03 00 00 01 01 01 01 02 02 01 02</pre>                                                                                            |

# ConnectionStatusMsg

---

**Type:** EXS SwitchKit API message

**Description** This message is sent by the Low-Level Communicator (LLC) to an application whenever any application connects to or disconnects from the LLC. These notifications go to applications. All applications connect to LLC. By default, LLC will send **ConnectionStatusMsg** messages to all applications. To disable this functionality, set SK\_DISABLE\_CSM =1.

**NOTE:** An application can use this message to determine that a software version mismatch has occurred. In this case, an application receives a **ConnectionStatusMsg** with status 0x06, which indicates there is an invalid connection. The application needs to manually delete the connection, otherwise, a loop will continue. In CSA, you will receive an error message saying the LLC is a different version of software and you should upgrade CSA for it to work.

This feature is also used, for example, to detect whether an application in a redundant pair disconnects. This includes notification of an LLC or SwitchManager switchover. In a redundant LLC set-up, if the primary LLC fails, a **ConnectionStatusMsg** is sent, stating that an application with the LLC name of '0' has disconnected. The '0' corresponds to the primary LLC.

There are two types of applications:

- Special Applications
  - SwitchManger and Redundant LLC (RLLC) are special applications. SwitchManger always connects to the LLC as the application named 1. RLLC always connects to the LLC as the application named 2.
- User Applications
  - User applications, including the Converged Services Administrator, connect to the LLC as applications with names greater than or equal to 10.

In a redundant LLC set-up, if the primary LLC (PLLC) fails, a **ConnectionStatusMsg** is sent, stating that an application with the LLC name of '0' has disconnected. The '0' corresponds to the primary LLC.

By default Switchkit applications, with the wrong version of software, will cause an error when attempting to connect to the LLC. The connection for this faulty application will be made to the LLC, and LLC will then send a **ConnectionStatusMsg** with an error code to all registered applications. All registered Switchkit applications will get a status of SK\_CSM\_NoCompat\_App\_SW (6) when this occurs.

Once the **ConnectionStatusMsg** had been successfully sent to all registered applications, the LLC will drop the connection, and log the following within the maintenance\_llc.log:

```

* Application Connection Failed
*
* Application cannot remain connected to LLC due to incompatible SK API
* software version.
*
* Application software version:08.02.03
* Switchkit software version:08.03.01

```

**Sent by** Application

**C Structure**

```
typedef struct {
 char IPAddress[50];
 UBYTE Status;
 int Name;
 UBYTE reserved72[4];
} SK_ConnectionStatusMsg;
```

**C++ Class**

```
class SKC_ConnectionStatusMsg : public SKC_ToolkitInbound
{
public:
 const char *getIPAddress() const;
 void setIPAddress(const char *x);
 UBYTE getStatus() const;
 void setStatus(UBYTE x);
 int getName() const;
 void setName(int x);
};
```

**Argument Values** The following table shows the possible values for the arguments of this message:

| Argument  | Value                                                                           | Description                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status    | <i>SK_CSM_OtherAppIDDropped</i>                                                 | Indicates the application has disconnected.                                                                                                                                                                                                                           |
|           | <i>SK_CSM_OtherAppIDConnected</i>                                               | Indicates another application has connected. This value is only received, if the application is registered for the connection status message. Then, the application will get the connection status message for itself and all other applications that connect to LLC. |
|           | <i>SK_CSM_AppIDReturnedFromPhantom</i>                                          | This is sent when an application reconnects to an LLC, either because it was disconnected and reconnected within the 15 second time-out period, or there was a switchover from the PLLC to the RLLC.                                                                  |
|           | <i>SK_CSM_CurrentAppIDConnected</i>                                             | The current application has connected to the LLC/ RLLC.                                                                                                                                                                                                               |
|           | <i>SK_CSM_AppDropped_NonCompatSoftware</i>                                      | Indicates a SwitchKit user application is trying to connect to an LLC which has a different software version. When a SwitchKit application connects to the LLC, it must have the same software version as the LLC it is connecting to.                                |
| Name      | The LLC name (i.e. integer) associated with the application                     | The LLC name (i.e. integer) associated with the application.                                                                                                                                                                                                          |
| IPAddress | IP address of the client that the LLC sees the incoming socket connecting from. | IP address of the client that the LLC sees the incoming socket connecting from.                                                                                                                                                                                       |

## CPC Detection 0x0047

---

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Type</b>           | EXS API and SwitchKit API message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>    | <p>This message enables or disables the detection of CPC (Calling Party Control), which is needed on FXO/LS channels. CPC is the means by which the calling end notifies the called end that the established connection is no longer needed. In this case, dialtone is used for notification.</p> <p>This feature can only be activated if the CSP contains an MFDSP or DSP-ONE card with at least one DSP configured for Call Progress Analysis. When CPC is detected, it is reported to the host in a <i>Call Processing Event</i> message.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# CreateConnection

---

**Type:** EXS SwitchKit API message

**Description** An application that needs to connect to a specific LLC must issue a function call **sk\_createConnection()**. The function then uses the *SK\_CreateConnection* message to establish the connection between the LLC and requesting application.

**Important!** It is not possible to send the CreateConnection message directly to the LLC.

**Sent by** Application

**C Structure**

```
typedef struct {
 UBYTE ConnectionID;
 char PriHost[30];
 char RedHost[30];
 unsigned short PriPort;
 unsigned short RedPort;
 UBYTE Action;
} SK_CreateConnection;
```

**C++ Class**

```
class SKC_CreateConnection : public SKC_ToolkitMessage {
public:
 UBYTE getConnectionID() const;
 void setConnectionID(UBYTE x);
 const char *getPriHost() const;
 void setPriHost(const char *x);
 const char *getRedHost() const;
 void setRedHost(const char *x);
 unsigned short getPriPort() const;
 void setPriPort(unsigned short x);
 unsigned short getRedPort() const;
 void setRedPort(unsigned short x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
};
```

## Cross Connect Channel 0x001A

---

**SwitchKit Name** CrossConnectChannel

**Type** EXS API and SwitchKit API message

**Description** This message makes a connection between two channels' data paths. No signaling information can be used to detect either channel releasing. The host must tear the connection down using the *Cross Disconnect Channel* message. If you cross-connect T1 and E1 channels, the result is automatic PCM conversion (A-law/ $\mu$ -law). By default, channels on T1 spans are  $\mu$ -law and channels on E1 spans are A-law. To disable conversion, as would be required if you connect through an ISDN D channel or SS7 link, you must configure both channels with the same format using the *PCM Encoding Format Configure* message.

This message is supported by the VDAC-ONE card but not the IP Network Interface Series 2 card.

**NOTE:** When cross-connecting channels across nodes in an CSP system, a separate message must be sent to each channel in the connection.

For example, you would send one message to Node 1: *Cross Connect Channel A, B*. You would send another message to Node 2: *Cross Connect Channel B, A*.

You can use optional fields for Encoding Format and Pad Value, which are described below the message table. The Encoding Format and Pad Value fields are required for cross-connections involving separate nodes in a multi-node system only.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossConnectChannel (
 Node = integer,
 SpanA = integer,
 ChannelA = integer,
 SpanB = integer,
 ChannelB = integer,
 AEncoding = integer,
 APad = integer,
 BEncoding = integer,
 BPad = integer);
```

### C Structure

```
typedef struct {
 unsigned short SpanA;
```

```

 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
 UBYTE AEncoding;
 UBYTE APad;
 UBYTE BEncoding;
 UBYTE BPad;
} XL_CrossConnectChannel;

```

### C++ Class

```

class XLC_CrossConnectChannel : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
 void setChannelB(UBYTE x);
 UBYTE getAEncoding() const;
 void setAEncoding(UBYTE x);
 UBYTE getAPad() const;
 void setAPad(UBYTE x);
 UBYTE getBEncoding() const;
 void setBEncoding(UBYTE x);
 UBYTE getBPad() const;
 void setBPad(UBYTE x);

```

### EXS API Hex Format

| <b>Description</b>    | <p>This message connects all data paths on Logical Span ID A to data paths on Logical Span ID B.</p> <p>When in E1 clear channel mode, this message does not connect time slot 16 (channel 30). You must use the <i>Cross Connect Channel</i> message to connect the data paths.</p> <p>Cross-connection of T1 and E1 spans is not supported. Multiframe alignment does not propagate from one side of the connection to the other.</p> <p><b>NOTE:</b> When cross-connecting channels across nodes in a multi-node system, a separate message must be sent to each channel in the connection.</p> <p>For example, you would send one message to Node 1: <i>Cross Connect Span</i> 0,1. You would send another message to Node 2: <i>Cross Connect Span</i> 1,0. You can use optional fields for Encoding Format and Pad Value, which are described below the message table. The Encoding Format and Pad Value fields are required for cross-connections involving separate nodes in a multi-node CSP system only.</p> |

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossConnectSpan (
 Node = integer,
 SpanA = integer,
 SpanB = integer,
 ChannelAEncoding = integer,
 ChannelAPad = integer,
 ChannelBEncoding = integer,
 ChannelBPad = integer);
```

**C Structure**

```
typedef struct {
 unsigned short SpanA;
 unsigned short SpanB;
 UBYTE ChannelAEncoding;
 UBYTE ChannelAPad;
 UBYTE ChannelBEncoding;
 UBYTE ChannelBPad;
} XL_CrossConnectSpan;
```

**C++ Class**

```

class XLC_CrossConnectSpan : public XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelAEncoding() const;
 void setChannelAEncoding(UBYTE x);
 UBYTE getChannelAPad() const;
 void setChannelAPad(UBYTE x);
 UBYTE getChannelBEncoding() const;
 void setChannelBEncoding(UBYTE x);
 UBYTE getChannelBPad() const;
 void setChannelBPad(UBYTE x);
};

```

**EXS API Hex Format**

| <b>Description</b>    | <p>This message instructs the CSP to disconnect the data paths of the channels specified (for SwitchKit, to disconnect the data paths of the channels that were connected by means of the CrossConnectChannel message).</p> <p><b>NOTE:</b> When cross-connecting channels across nodes in a CSP system, a separate message must be sent to each channel in the connection.</p> <p>For example, you would send one message to Node 1:</p> <ul style="list-style-type: none"> <li><i>Cross Disconnect Channel</i> (CrossDisconnectChannel) A, B.</li> </ul> <p>You would send another message to Node 2:</p> <ul style="list-style-type: none"> <li><i>Cross Disconnect Channel</i> (CrossDisconnectChannel) B, A.</li> </ul> |

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossDisconnectChannel (
 Node = integer,
 SpanA = integer,
 ChannelA = integer,
 SpanB = integer,
 ChannelB = integer);
```

**C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
} XL_CrossDisconnectChannel;
```

**C++ Class**

```
class XLC_CrossDisconnectChannel : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
 void setChannelB(UBYTE x);
};
```

| <b>Description</b>    | This message assigns a channel as an ISDN PRI or an ISDN Series 3 D channel or a substrate channel as an ISDN BRI channel. ISDN channels can be assigned as either primary or secondary. |
| <b>Sent by</b>        | Host                                                                                                                                                                                     |
| <b>SwitchKit Code</b> | <b>Configuration</b>                                                                                                                                                                     |

In the configuration below you can replace:

```
PriDChannelSpanID = integer,
PriDChannel = integer,
```

with

```
SecondaryDChannelSpanID = integer,
SecondaryDChannel = integer,
```

```
DChannelAssign (
 Node = integer,
 Slot = integer,
 PriDChannelSpanID = integer,
 PriDChannel = integer,
 SecondaryDChannelFacility = integer,
 DChannelType = integer,
```

### C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE SecondaryDChannelFacility;
 UBYTE DChannelType;
 UBYTE Data;
} XL_DChannelAssign;
```

### C++ Class

```
class XLC_DChannelAssign : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSecondaryDChannelFacility() const;
 void setSecondaryDChannelFacility(UBYTE x);
 UBYTE getDChannelType() const;
 void setDChannelType(UBYTE x);
 UBYTE getData() const;
 void setData(UBYTE x);
};
```

**Secondary D Channel Facility**

The table below shows timeslots on an E1 span that map to logical channels in the CSP. You must assign D channels to timeslot 16 (Channel 30 (0x1E) as noted with shading). You cannot use Channels 30 and 31 for voice/data when configured for ISDN applications.

## D Channel Assign 0x00C4

| Timeslot | Logical Channel |
|----------|-----------------|
| 0        | 31              |
| 1        | 0               |
| 2        | 1               |
| 3        | 2               |
| 4        | 3               |
| 5        | 4               |
| 6        | 5               |

| <b>Description</b>    | This message is used by the host to de-assign an ISDN PRI D channel. The D channel may then be re-assigned using the <i>D Channel Assign</i> message. D channel De-assign messages must be sent for each of the D channels (DSOs) making up the Super Rate D channel. The base D channel must be de-assigned before any of the others can be de-assigned.                                                                                                                                       |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## D Channel Facility List Configure 0x00C6

---

**SwitchKit Name** DChannelFacilityListConfig

**Type** EXS API and SwitchKit API message

**Description** This message is used by the host to add or delete spans from the facility list of D channels in NFAS mode. A D channel can control up to 20 spans of NI2 channels and 10 spans for all other channel types. The span where the D channel is assigned is automatically added to the facility list as Facility 0. You do not need to add it to the facility list using this message.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
DChannelFacilityListConfig (
 Node = integer,
 Span = integer,
 Channel = integer,
 FacilitySpan = integer,
 Action = integer,
 FacilityNum = integer);
```

### C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 unsigned short FacilitySpan;
 UBYTE Action;
 UBYTE FacilityNum;
} XL_DChannelFacilityListConfig;
```

### C++ Class

```
class XLC_DChannelFacilityListConfig : public
 XLC_OutboundMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 unsigned short getFacilitySpan() const;
 void setFacilitySpan(unsigned short x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
 UBYTE getFacilityNum() const;
 void setFacilityNum(UBYTE x);
};
```

**EXS API Hex Format**

Use the Channel and Span address type for this message. The table that follows shows you the format for addressing the span for Facility 0. Repeat the same format for facilities 1–9 (0x01–0x09) or 1–19 (0x01–0x13) for NI2 channels only.

| Byte             | AIB Field Description        |
|------------------|------------------------------|
| Channel          |                              |
| 0                | Address Type (0x0D)          |
| 1                | Data Length (0x03)           |

# Download Begin BRecord 0x009B

---

**SwitchKit Name** DownloadBeginBRecord

**Type** EXS API and SwitchKit API message

**Description** This message should not be sent by the host to standby Matrix Controller cards, since the Matrix Controller cards receive their loads from the TFTP download.

However, you can use this message to configure active Matrix Controller cards.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 } XL_DownloadBeginBRecord;
```

**C++ Class**

```
class XLC_DownloadBeginBRecord : public
 XLC_OutboundMessage {
public:
 };
```

**Timestamp** This field is a long word received Most Significant Byte first, and Least Significant Byte last. It is associated with the newly downloaded system software once it has been validated.

This field is used to determine which matrix has the most recent system software in a redundant system when two different system software versions are present. In this situation the system software with the highest timestamp will be transferred to the other matrix.

As far as the matrices are concerned, the timestamp has nothing to do with time, but it is suggested that the host use a time-related number in this field. The host must guarantee that each new load has a higher timestamp than the previous one or the new load will be overwritten with the system software from the other matrix. The format of the timestamp is number of seconds since January 1, 1970.

| <b>Description</b>    | This message informs the host of the current status of the channel specified. It is sent when the status of a channel has changed. All host applications must be designed to handle this message for out-of-service and in-service conditions. |
| <b>Sent by</b>        | CSP                                                                                                                                                                                                                                            |
| <b>Resent</b>         | This message is resent once after five seconds.                                                                                                                                                                                                |

### SwitchKit Code C Structure

```
typedef struct {
 BaseFields Base;
 UBYTE AddrInfo[30];
 UBYTE ChannelStatus;
 UBYTE PurgeStatus;
} XL_DS0StatusChange;
```

### C++ Class

```
class XLC_DS0StatusChange : public XLC_InboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 XBYTE getStartSpan() const;
 void setStartSpan(XBYTE x);
 UBYTE getStartChannel() const;
 void setStartChannel(UBYTE x);
 XBYTE getEndSpan() const;
 void setEndSpan(XBYTE x);
 UBYTE getEndChannel() const;
 void setEndChannel(UBYTE x);
 XBYTE getSpan() const;
 void setSpan(XBYTE x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getChannelStatus() const;
 void setChannelStatus(UBYTE x);
 UBYTE getPurgeStatus() const;
 void setPurgeStatus(UBYTE x);
};
```

### Tip for C Programmers

To extract the span and channel in the C version of the API, you need to use the following code:

```
CASE_DS0StatusChange(ds0) {
```

```

printf("DS0 Stat Change, Span:%d, Chan:%d, Purge:%X\n",
 sk_getAIBSpan(ds0->AddrInfo),
 sk_getAIBChannel(ds0->AddrInfo),
 ds0->ChannelStatus,
 ds0->PurgeStatus);
return OK;
}

```

**EXS API Hex Format**

| 0xE0  | Layer 4 response timeout      | SIP timed out waiting for a response from Layer 4.                                                                                             |                                                                                              |
| 0xE1  | Invalid SDP/NPDI data         | In call agent mode, the user puts invalid data (typically sdp) in the <i>Connect With Data</i> message                                         |                                                                                              |
| 0xE2  | Invalid coupled channel state | The physical span/channel identifier provided by the host application (typically for call gent mode coupling) is in non-idle state in the CSP. | Resolve glare issues between the CSP and the host channel hunting and allocation algorithms. |

## DS3 Configure/Query 0x000F

---

**SwitchKit Name** DS3GenericMessage

**Type** EXS API and SwitchKit API message

**Description** Use this message to perform the following:

- Configure Loopback Mode
- Query Loopback Mode
- DS3 Framer Configure and Query

**NOTE:** You must take a DS3 (Entity 1) or the DS3 spans (Entity 3) out of service before you can place it into local loop back. The DS3 AIB must always be 0.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
DS3GenericMessage (
 Node = integer,
 Slot = integer,
 DS3 = integer,
 Entity = integer,
 DataLength = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 UBYTE Slot;
 UBYTE DS3;
 UBYTE Entity;
 UBYTE DataLength;
 UBYTE Data[221];
} XL_DS3GenericMessage;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE Slot;
 UBYTE DS3;
 UBYTE Entity;
 UBYTE DataLength;
 UBYTE Data[219];
} XL_DS3GenericMessageAck;
```

### C++ Class

```
class XLC_DS3GenericMessage : public XLC_OutboundMessage
{
public:
```

```

 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDS3() const;
 void setDS3(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

### C++ Class Response

```

class XLC_DS3GenericMessageAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDS3() const;
 void setDS3(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

### EXS API Hex Format

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE ServiceType;
 UBYTE reserved48[222];
} XL_DSPServiceCancel;
```

### C++ Class

```
class XLC_DSPServiceCancel : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getServiceType() const;
 void setServiceType(UBYTE x);
};
```

### EXS API Hex Format

| <b>Description</b>    | <p>Use this message to allocate a DSP service on the specified channel. DSP services supported are:</p> <ul style="list-style-type: none"> <li>• DTMF Reception</li> <li>• Energy Detection</li> <li>• Call Progress Analysis Reception</li> <li>• Coin Tone Reception (DSP-ONE Only)</li> </ul> <p>After this message is sent the CSP sends the <i>Call Processing Event</i> (0x2E) message to report the occurrence of a corresponding Event on the specified channel. However, if the DSP service type is <i>Call Progress Analysis</i> (0x03) the CSP answers with a <i>Call Progress Analysis Result</i> (0x34) message.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| : | <p>Data[0 . . . ]</p> <p>The meaning of the <i>Data</i> fields depends on the <i>Service Type</i>. See below.</p> <p>0x01 DTMF Receiver (0x01) and<br/> 0x81 DTMF Receiver, Matrix Based RFC 2833 Collection<br/> 0xE1 DTMF Receiver with Termination of Tone/Announcement</p> <p>The DTMF receiver data instructs the CSP to attach a digit receiver to the specified channel and to start collecting digits. The call must be in a state other than idle, out of service, or busied out. The CSP sends Call Processing Event messages with event “digits” for every digit collected. If an error condition occurs, the CSP sends a Call Processing Event message with the “Status” field indicating the error.</p> <p>The host application is responsible for instructing the CSP to release the digit receiver when either the receiver is finished collecting digits or when an error condition occurs. The host accomplishes the release by sending a DSP Service Cancel message. If the call is disconnected, the CSP releases the digit receiver.</p> <p>Data[0,1] Digit Timer<br/> The maximum amount of time to wait for the digit.<br/> The following values disable this timer:<br/> 0xFFFF<br/> 0x0000<br/> 0x0001<br/> 0x0002</p> <p>Data[2] Configuration Bits (0 = disabled, 1 = enabled)<br/> Bit 0 Report the digit at its falling edge (when the first digit is released).<br/> If the bit is not set the digit will be reported at its rising edge (when the digit is first entered).<br/> Bit 1 Ignore “#” character as first digit.<br/> Bit 2 Report digit duration (the amount of time the digit has been pressed).<br/> Valid only if Configuration Bit Number 0 is 1.<br/> Bits 3–7 Reserved, must be 0.</p> <p>Data[3,4] Minimum Receive Digit Duration Timer<br/> Valid timer values: 0x0000–0xFFFE</p> <p>The minimum amount of time for a digit to be present before it is detected and validated.<br/> If you send the values 0x0000 through 0x0002, the CSP automatically sets the time to 0x0003.</p> <p>NOTE: You may set either the Digit Timer or the Minimum Digit Duration timer to 0xFFFF, but <b>not both</b>. If you set both timers to 0xFFFF, this message cannot detect digits.</p> <p>Data[5] Termination Digit for Playback/Tone Generation<br/> 0xFF Any DTMF termination digit for terminating playback/tone generation<br/> 0xFF Any DTMF termination digit for terminating playback/tone generation<br/> Note: Data[5] used with <i>Service Type</i> 0xE1 only</p> |

| <b>Description</b>                                       | <p>Use this message to configure a SIMM on a DSP card. Each SIMM is populated with four DSPs. The host can specify the function to be downloaded to each DSP.</p> <p>You must take a SIMM out of service before sending this message. After receiving an Acknowledgment to the <i>DSP SIMM Configure</i> message, bring the SIMM back in service.</p> <p>On the DSP-ONE card, each DSP can only handle one function, and four DSPs are configured at the same time.</p> <p>On the DSP Series 2 card, each DSP can handle multiple functions, so the DSP Chip AIB (0x22) is used to configure individual DSP chips.</p> <p><b>NOTE:</b> When configuring DSP cards for MFR2 signaling, each card that contains MFR2 receivers must also have MFR2 backward and forward transmitters. If MFR2 Receivers only are present, an incoming call causes an alarm that specifies “DSP Function Not Configured” and the MFR2 receivers are not used.</p> |

**Slot Number**    The slot numbers are as follows:

CSP 2090: 0x00–0x0F - Physical slot number of the DSP card

CSP 2040: 0x00–0x03 - Physical slot number of the DSP card

**SIMM Number** The SIMM numbers are as follows:  
DSP-ONE Card: 0x00–0x03  
DSP Series 2 Card: 0x00 or 0x01

**Function** On the DSP Series 2 card, each field configures a function on a single chip on a DSP. On the DSP-ONE card, each field configures a function on an entire DSP.

### **DSP Series 2**

Function 1 = RCV 0

Function 2 = TXMT 0

Function 3 = RCV 1

Function 4 = TXMT 1

### **DSP-ONE**

Function 1 = DSP 0

Function 2 = DSP 1

Function 3 = DSP 2

Function 4 = DSP 3

**Function Types** 0x00 - No Function Type

### **Tone Reception**

0x01- DTMF  $\mu$ -law

0x02 - MFR1  $\mu$ -law

0x03 - DTMF A-Law

0x04 - MFR1 A-Law

0x05 - MFR2 A-Law

0x06 - MFR2  $\mu$ -Law

0x07 - CPA A-Law

0x08 - CPA  $\mu$ -Law

0x09 - E1 Dial Pulse (DSP-ONE only)

0x0A - Energy Detection

0x0E - Coin Detection  $\mu$ -Law (DSP-ONE only)

0x0F - Coin Detection A-Law (DSP-ONE only)

### **Tone Generation**

#### DSP Series 2

0x30 - Universal Tone Generation  $\mu$ -Law

0x31 - Universal Tone Generation A-Law

#### DSP-ONE

0x10 - DTMF  $\mu$ -Law

0x11 - DTMF A-Law

0x12 - MFR1  $\mu$ -Law

0x13 - MFR1 A-Law

0x14 - CPT4  $\mu$ -Law

0x15 - CPT4 A-Law

0x16 - MFR2 Forward A-Law

0x17 - MFR2 Forward  $\mu$ -Law

0x18 - MFR2 Backward A-Law

0x19 - MFR2 Backward  $\mu$ -Law

0x1A - Bong Tone  $\mu$ -Law

0x1B - Bong Tone A-Law

#### **Fax**

0x32 - Send/Receive Fax

#### **File Playback / Record (DSP Series 2 Only)**

0x1D - File Playback / Record

#### **Conferencing**

##### DSP Series 2

0x21 - Monitor

0x22 - Unified

0x23 - DTMF-Clamped \*

\* This option is for backward compatibility. With the DSP Series 2 card you can create a Unified Conference with DTMF Clamping enabled, which is the recommended method

##### DSP-ONE

0x1E - Standard  $\mu$ -Law

0x1F - Standard A-Law

0x20 - Mixed

0x21 - Monitor

0x22 - Unified

0x23 - DTMF-Clamped

NOTE: You cannot configure a VRAS SIMM.

**Miscellaneous**

0x33 - Echo Cancel (DSP Series 2 Only)

0x34 - Positive Voice Detection/Answering Machine Detection (PVD/AMD)  
(DSP Series 2 Only)**Frequency Shift Keying**

0x35 - Transmit FSK only (DSP Series 2 Only)

0x36 - Transmit and Receive FSK (DSP Series 2 Only)

**Default Function Types on  
the DSP Series 2 card**

| Module Number | DSP Number | Rcv 0                       | Txmt 0                      | Rcv 1                       | Txmt 1                      |
|---------------|------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| 0             | 0          | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) |
| 0             | 1          | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) |
| 0             | 2          | CPA $\mu$ -law (0x08)       | Universal $\mu$ -law (0x30) | CPA $\mu$ -law (0x08)       | Universal $\mu$ -law (0x30) |
| 0             | 3          | File Playback/Record (0x1D) | Not allowed (0x00)          | File Playback/Record (0x1D) | Not allowed (0x00)          |
| 1             | 0          | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) |
| 1             | 1          | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) | DTMF $\mu$ -law (0x01)      | Universal $\mu$ -law (0x30) |
| 1             | 2          | MFR1 $\mu$ -law (0x02)      | Universal $\mu$ -law (0x30) | MFR1 $\mu$ -law (0x02)      | Universal $\mu$ -law (0x30) |
| 1             | 3          | MFR1 $\mu$ -law (0x02)      | Universal $\mu$ -law (0x30) | MFR1 $\mu$ -law (0x02)      | Universal $\mu$ -law (0x30) |

**Configuration Options on  
the DSP Series 2 Card**

The following table shows configuration options for function types on the DSP Series 2 card.

| Rcv 0                               | Txmt 0                   | Rcv 1                               | Txmt 1                   |
|-------------------------------------|--------------------------|-------------------------------------|--------------------------|
| Any Tone Receiver Function          | Universal Tone Generator | Any Tone Receiver Function          | Universal Tone Generator |
| File Record or Playback             | Not allowed (0x00)       | File Record or Playback             | Not allowed (0x00)       |
| T.30 Fax                            | Not allowed (0x00)       | T.30 Fax                            | Not allowed (0x00)       |
| Echo Cancel                         | Not allowed (0x00)       | Echo Cancel                         | Not allowed (0x00)       |

### Configuration FSK Options on the DSP Series 2 Card

The following table shows configuration options for the FSK function types on the DSP Series 2 card.

| Rcv 0                           | Txmt 0                   | Rcv 1                           | Txmt 1                   |
|---------------------------------|--------------------------|---------------------------------|--------------------------|
| Any Tone Receiver Function      | Transmit FSK Only (0x35) | Any Tone Receiver Function      | Transmit FSK Only (0x35) |
| Transmit and Receive FSK (0x36) | Not allowed (0x00)       | Transmit and Receive FSK (0x36) | Not allowed (0x00)       |

### Default Function Types on the DSP-ONE Card

For more information, please refer to the DSP Resources of the *Developer's Guide: Overview*.

The table below shows the default SIMM and DSP configurations.

|        | DSP 0                     | DSP 1                     | DSP 2                     | DSP 3                     |
|--------|---------------------------|---------------------------|---------------------------|---------------------------|
| SIMM 0 | 0x01<br>μ-law<br>DTMF Rec | 0x01<br>μ-law<br>DTMF Rec | 0x01<br>μ-law<br>DTMF Rec | 0x01<br>μ-law<br>DTMF Rec |

# DynamicConfig

---

|                    |                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | EXS SwitchKit API message                                                                                                                                                                                                                                                                      |
| <b>Purpose</b>     | Use the <i><b>SK_DynamicConfig</b></i> message to dynamically update the CSP configuration without restarting the SwitchManager. This message includes an argument, ConfigMode, which determines whether the specified file content will be saved by SwitchManager for future reconfiguration. |
| <b>Description</b> | When SwitchManager receives a DynamicConfig message, it will send the configuration referenced in the message to the CSP immediately. Those messages are maintained on the CSP. The filename must be relative to the SwitchManager process.                                                    |
| <b>Sent by</b>     | Converged Services Administrator or Application                                                                                                                                                                                                                                                |
| <b>Arguments</b>   | The following table shows the user modifiable arguments for this message:                                                                                                                                                                                                                      |

| Argument   | Description                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ConfigMode | This enables or disables writing the content of the specified file into the current configuration file used by Switch Manager. The options are:<br><br>SK_CONFIGSWITCH_APPEND - 0x00<br>SK_CONFIGSWITCH_SEND_NOAPPEND - 0x04 |
| Filename   | The filename of the file containing the configuration information to parse and send. Location should be relative to SwitchManagers installation directory.                                                                   |

**C Structure**

```
typedef struct {
 UBYTE ConfigMode;
 char Filename[230];
} SK_DynamicConfig;
```

**C Structure Response**

```
typedef struct {
 int Status;
} SK_DynamicConfigAck;
```

**C++ Class**

```
class SKC_DynamicConfig : public SKC_ToolkitMessage {
public:
 UBYTE getConfigMode() const;
 void setConfigMode(UBYTE x);
 const char *getFilename() const;
```

```
void setFilename(const char *x);
};
```

**C++ Class Response**

```
class SKC_DynamicConfigAck : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
 const UBYTE *getReserved() const;
 UBYTE *getReserved();
 void setReserved(UBYTE *x);
};
```

## E1 Span Configure 0x00D8

| <b>SwitchKit Name</b>  | E1SpanConfig                                                                                                                                                                                                                                             |
| <b>Type</b>            | EXS API and SwitchKit API message                                                                                                                                                                                                                        |
| <b>Description</b>     | This message allows the host to configure the transmission format, line length, and SA bits of an E1 span.                                                                                                                                               |
| <b>Sent by</b>         | Host                                                                                                                                                                                                                                                     |
| <b>Example Message</b> | The following sample message configures an E1 span with the default coding method, signaling method, E1 Layer I management. CRC-4 and FEBE error checking are configured. The default line length, SA Registers, and TS 16 Register are also configured. |

```
00 0F 00 D8 00 FF FF 00 01 0C 02 01 23 E8 00 F8 D0
```

### SwitchKit Code Configuration

```
E1SpanConfig (
 Node = integer,
 Span = integer,
 Format = integer,
 LineLength = integer,
 SARegisters = integer,
 TS16Registers = integer);
```

### C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Format;
 UBYTE LineLength;
 UBYTE SARegisters;
 UBYTE TS16Registers;
} XL_E1SpanConfig;
```

### C++ Class

```
class XLC_E1SpanConfig : public XLC_SpanMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getFormat() const;
 void setFormat(UBYTE x);
 UBYTE getLineLength() const;
 void setLineLength(UBYTE x);
 UBYTE getSARegisters() const;
 void setSARegisters(UBYTE x);
 UBYTE getTS16Registers() const;
 void setTS16Registers(UBYTE x);
};
```

**EXS API Hex Format**

| MESSAGE (White) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | RESPONSE (Gray) |                       |

## NOTES

1. To configure a single node for greater than 64 spans, please contact Cantata technical support.
2. Note that the Cantata message bit-numbering format is 0–7, while the SA Register and TS 16 Register formats are 1–8. Therefore, bit 3 of the host message format is bit 4 of the SA Register and TS 16 Register formats, and so on.
3. This message is backward-compatible to previous software releases.
4. Refer to ITU-T Recommendation G.704 more details on programming SA bits and spare timeslot 16 bits.
5. To use Euro-ISDN Layer 1, you must use an SE1LC Rev. B11 or greater. For more information, refer to the appropriate *“Hardware Product Descriptions.”*
6. For Euro-ISDN compliant E1, set the following:  
(Bit 0 = 1) Line format to HDB3  
(Bit 1 = 1) CRC  
(Bit 2 = 1) FEBE  
(Bit 3 = 1) E1 clear Channel  
(Bit 5 = 1) Euro-ISDN Layer I  
Line length to G.703
7. For Austel-ISDN compliant E1, set the following:  
(Bit 0 = 1) Line format to HDB3  
(Bit 1 = 1) CRC  
(Bit 2 = 1) FEBE

(Bit 3 = 1) E1 clear Channel  
 (Bit 6 = 1) Austel-ISDN Layer I  
 Line length to G.703

**Default E1 Format**

The table below shows the default format for E1 spans. You must enable Clear Channel signaling to use timeslot 16 (Channel 30) as a voice channel or for out-of-band signaling (for example, an ISDN application).

**NOTE:** Clear Channel signaling must be enabled to use timeslot 16 (channel 30) as a D channel in ISDN applications.

| Timeslot | Channel | Description                  |
|----------|---------|------------------------------|
| 0        | 31      | Alarms and framing           |
| 1        | 0       | Voice channels               |
| 2        | 1       |                              |
| 3        | 2       |                              |
| 4        | 3       |                              |
| 5        | 4       |                              |
| 6        | 5       |                              |
| 7        | 6       |                              |

| <b>SwitchKit Name</b> | E1SpanFormatQuery                                                                   |
| <b>Type</b>           | EXS API and SwitchKit API message                                                   |
| <b>Description</b>    | Use this message to retrieve the transmission format and line length of an E1 span. |
| <b>Sent by</b>        | Host                                                                                |

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Span;
} XL_E1SpanFormatQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Format;
 UBYTE LineLength;
 UBYTE Slot;
 UBYTE Offset;
 UBYTE SRegisters;
 UBYTE TS16Register;
} XL_E1SpanFormatQueryAck;
```

### C++ Class

```
class XLC_E1SpanFormatQuery : public XLC_OutboundMessage
{
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
};
```

### C++ Class Response

```
class XLC_E1SpanFormatQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getFormat() const;
 void setFormat(UBYTE x);
 UBYTE getLineLength() const;
 void setLineLength(UBYTE x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getOffset() const;
```

```

void setOffset(UBYTE x);
UBYTE getSARegisters() const;
void setSARegisters(UBYTE x);
UBYTE getTS16Register() const;
void setTS16Register(UBYTE x);
};

```

**EXS API Hex Format**

## NOTES

1. The Cantata message bit-numbering format is 0–7, while the SA Register and TS 16 Register formats are 1–8. Therefore, bit 3 of the host message format is bit 4 of the SA Register and TS 16 Register formats, and so on.
2. This message is backward-compatible to previous software releases. If using a System Software 3.X Version 3.09 or earlier, the SA Register and TS 16 Register bits will be set to the default (1), and an *E1 Span Query* message will return a value of 0xF8 for the SA Register byte and 0xD0 for the TS 16 Register byte.

## EXNET Ring Configure 0x0074

### SwitchKit Code Configuration

```
RingConfig (
 Node = integer,
 Slot = integer,
 Ring = integer,
 Entity = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE Entity;
 UBYTE Data[222];
} XL_RingConfig;
```

### C++ Class

```
class XLC_RingConfig : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

| MESSAGE (White) |                            | RESPONSE (Gray) |                       |

## 0x01 Assign Ring

Data[0] Logical Ring ID

## De-assigning an EXNET Ring

Use the values below to de-assign a specific ring or all rings on a node:

## 0x02 Configure Transmit Mode

Data[0] Transmit Mode

0x00 Receive Only

0x01 Transmit and Receive

## 0x03 Configure Number of Packets

Data[0] Number of Packets

0x01 - No longer used.

0x03 - No longer used.

0x04 - Four packets (E1, J1, VDAC-ONE, IP Network Interface Series 2, and PCI H.100 EXNET Connect nodes).

## 0x04 EXNET-ONE Card Diagnostics

Data[0] EXNET-ONE Card Diagnostics

0x00 Reserved

0x01 Non-Forced\*, Internal Loop Back

0x02 Non-Forced\*, External\*\* Loop Back

0x03 Forced, Internal Loop Back

0x04 Forced, External\*\* Loop Back

\*The Non-Forced mode is used to prevent execution of EXNET-ONE Card Diagnostics procedure while EXNET Ring is up and running. Performing EXNET-ONE Card Diagnostics will take the EXNET Ring out of service.

\*\*The External Loop Back mode can be used when both I/O ports are externally looped back with fiber optic cabling.

## 0x05 Prepare For Addition

There is no data associated with this entity.

## 0x06 Expand Ring

There is no data associated with this entity.

## 0x07 Loop Back Port

Node ID of the neighbor CSP node. This message must be sent to the node that will loopback its "A" port. The neighbor node will automatically loopback "B" port.

Data[0] 0x00 Logical Node ID of node whose "B" port will be looped back.

## 0x08 Add Node

There is no data associated with this entity.

|   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|   | <p>0x09 Master-configurable</p> <p>The value of this field indicates whether or not a node is allowed to become the EXNET Ring Master. Valid entries for these fields, based on the value of the <i>Entity</i> field value 0x09, are as follows:</p> <p>Data[0] Allow Master Arbitration Flag.</p> <p>0x00 Do not allow this node to participate in EXNET Ring Master Arbitration.</p> <p>0x01 Allow this node to participate in EXNET Ring Master Arbitration. (Default for CSP 2090 and CSP 2040 nodes)</p> <p>0x0A Ring Mode</p> <p>The Ring Mode entity configures the Enhanced Fault Tolerance Ring Mode.</p> <p>Data[0] Ring Mode</p> <p>0x00 Reserved</p> <p>0x01 Enhanced Fault Tolerance Ring Mode</p> <p>This mode adds enhanced Single Ring Redundancy with seamless switchover support, run-time software link validation, enhanced live node insertion, and overall improved performance and stability. This mode is recommended for homogenous second generation EXNET rings.</p> |

### SwitchKit Code Configuration

```
NodeConfig (
 Node = integer,
 Entity = integer,
 DataLen = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 unsigned short Entity;
 UBYTE DataLen;
 UBYTE Data[250];
} XL_NodeConfig;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Entity;
 UBYTE DataLength;
 UBYTE Data[248];
} XL_NodeConfigAck;
```

### C++ Class

```
class XLC_NodeConfig : public XLC_OutboundMessage {
public:
 unsigned short getEntity() const;
 void setEntity(unsigned short x);
 UBYTE getDataLen() const;
 void setDataLen(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### C++ Class Response

```
class XLC_NodeConfigAck : public XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getEntity() const;
```

```

void setEntity(unsigned short x);
UBYTE getDataLength() const;
void setDataLength(UBYTE x);
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x);
};

```

## EXS Node Configuration Query 0x007E

---

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <b>SwitchKit Name</b> | NodeConfigQuery                                                     |
| <b>Type</b>           | EXS API and SwitchKit API message                                   |
| <b>Description</b>    | Use this message to query various configuration entities in a node. |
| <b>Sent by</b>        | Host                                                                |

### SwitchKit Code C Structure

```
typedef struct {
 unsigned short Entity;
 UBYTE DataLen;
 UBYTE Data[250];
} XL_NodeConfigQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Entity;
 UBYTE DataLength;
 UBYTE Data[248];
} XL_NodeConfigQueryAck;
```

### C++ Class

```
class XLC_NodeConfigQuery : public XLC_OutboundMessage {
public:
 unsigned short getEntity() const;
 void setEntity(unsigned short x);
 UBYTE getDataLen() const;
 void setDataLen(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### C++ Class Response

```
class XLC_NodeConfigQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getEntity() const;
 void setEntity(unsigned short x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

| <b>Description</b>    | <p>This message should be sent by the host if it receives a <i>Card Status Report</i> message or a response to a <i>Card Status Query</i> message with the “Faults Logged” bit set. Faults are queried for the slot specified. The host receives separate responses for each fault logged. There are two types of logs: a fault log containing a log that can be cleared after it is reported by setting the Action field to 0x02. The response data should be reported to Cantata Technical Support for evaluation.</p> <p>The host can also send this message to the active or standby Matrix Controller card.</p>                                                                                                                                                                                                           |

**NOTES:**

1. Faults are logged as NULL terminated readable text strings. The host will receive a message for each fault in the log.
2. When in any state other than active, the only valid slot is the matrix that the message is sent to. All requests for other slots will receive a response status of negative acknowledgment.

## Filter/Timer Configure 0x0012

---

**SwitchKit Name** FilterTimerConfig

**Type** EXS API and SwitchKit API message

**Description** This message is used to adjust trunk and line signaling filters and timers. Typically, it is only required when the trunk or line that the CSP is connected to is not operating to line interface specifications.

All timers and filters are set to default values based on industry specifications when the channel trunk type is configured. To query the timers and filters use the *Channel Parameter Query* message.

**NOTE:** Use this message to configure the PPL timers for all ST1LC line cards. You cannot use the *PPL Timer Configure* message with the ST1LC line cards.

**Sent by** Host

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

**SwitchKit Code** **Configuration**

```
FilterTimerConfig (
 Node = integer,
 Range = StartSpan:StartChan - EndSpan:EndChan,
 Type = integer,
 FilterID = integer,
 Value = integer);
```

### C Structure

```
typedef struct {
 unsigned short StartSpan;
 UBYTE StartChannel;
 unsigned short EndSpan;
 UBYTE EndChannel;
 UBYTE Type;
 UBYTE FilterID;
 unsigned short Value;
} XL_FilterTimerConfig;
```

### C++ Class

```
class XLC_FilterTimerConfig : public XLC_ChangeRangeMessage
{
public:

| <b>SwitchKit Name</b> | FlashTimingConfig                                                                                        |
| <b>Type</b>           | EXS API and SwitchKit API message                                                                        |
| <b>Description</b>    | Use this message to enable or disable flash detection and propagation on a channel or range of channels. |
| <b>Sent by</b>        | Host                                                                                                     |

### SwitchKit Code Configuration

```
FlashTimingConfig (
 Node = integer,
 Range = StartSpan:StartChan - EndSpan:EndChan,
 FlashMode = integer);
```

### C Structure

```
typedef struct {
 unsigned short StartSpan;
 UBYTE StartChannel;
 unsigned short EndSpan;
 UBYTE EndChannel;
 UBYTE FlashMode;
} XL_FlashTimingConfig;
```

### C++ Class

```
class XLC_FlashTimingConfig : public XLC_ChangeRangeMessage
{
public:
 unsigned short getStartSpan() const;
 void setStartSpan(unsigned short x);
 UBYTE getStartChannel() const;
 void setStartChannel(UBYTE x);
 unsigned short getEndSpan() const;
 void setEndSpan(unsigned short x);
 UBYTE getEndChannel() const;
 void setEndChannel(UBYTE x);
 UBYTE getFlashMode() const;
 void setFlashMode(UBYTE x);
};

## ForceGroupState

---

**Type** EXS SwitchKit API message

**Purpose** This message causes the LLC to take action on all of the channels within the group specified by the ChannelGroup field. This will only affect channels not currently owned or watched by another application.

**Sent by** SwitchKit Application

**Arguments** The following table shows the arguments you can change:

| Argument     | Description                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ChannelGroup | The name of the group this action should be performed on.                                                                                           |
| action       | The state the LLC is requesting this channel be put into. Values for ForceGroupState actions:<br><br>SK_OUT_OF_SERVICE =0x0F<br>SK_IN_SERVICE =0xF0 |
| int status   | This is a response argument. The values are:<br><br>SK_INVALID_GROUP - No valid channel group was found.<br>OK - Success                            |

### Response Arguments

| Argument     | Description                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------|
| ChannelGroup | The name of the group this action should be performed on.                                                     |
| int status   | The values for this argument are:<br><br>SK_INVALID_GROUP - No valid channel group was found.<br>OK - Success |

**C Structure**      typedef struct {  
                      char ChannelGroup[50];  
                      unsigned short Action;  
                      UBYTE reserved69[4];  
                      } ***SK\_ForceGroupState***;

**C Structure Response**      typedef struct {  
                      char ChannelGroup[50];  
                      int Status;  
                      UBYTE reserved71[4];  
                      } ***SK\_ForceGroupStateAck***;

**C++ Class**      class ***SKC\_ForceGroupState*** : public SKC\_ToolkitMessage {  
     public:  
         const char \*getChannelGroup() const;  
         void setChannelGroup(const char \*x);  
         unsigned short getAction() const;  
         void setAction(unsigned short x);  
     };

**C++ Class Response**      class ***SKC\_ForceGroupStateAck*** : public SKC\_ToolkitAck {  
     public:  
         const char \*getChannelGroup() const;  
         void setChannelGroup(const char \*x);  
         int getStatus() const;  
         void setStatus(int x);  
     };

## Generate Call Processing Event 0x00BA

# Generic Card Configure 0x0122

---

**SwitchKit Name** GenericCardConfigure

**Type** EXS API and SwitchKit API message

**Description** Use this message for a variety of card configuration options.

## DSP Series 2 Card

For the DSP Series 2 card, use this message to configure the following:

- Card-level Defaults
- Alarms
- NFS location and Vocabulary Index File
- Sequence Number Size (8-bit or 16-bit)
- Advanced Conferencing Features
- T.30 Fax Parameters
- Positive Voice Detection/Answering Machine Detection
- Echo Cancellation Parameters

**Sent by** Host Application

**Related API Message** *Generic Card Query*

## SwitchKit Code C Structure

```
typedef struct {
 UBYTE Slot;
 UBYTE reserved18[29];
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_GenericCardConfigure;
```

## C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE reserved6[13];
 UBYTE TLVCount;
 UBYTE Data[250];
} XL_GenericCardConfigure;
```

## C++ Class

```
class XLC_GenericCardConfigure : public
 XLC_OutboundMessage {
public:
```

```
UBYTE getSlot() const;
void setSlot(UBYTE x);
UBYTE getDataType() const;
void setDataType(UBYTE x);
UBYTE getTLVCount() const;
void setTLVCount(UBYTE x);
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x);
};
```

### **C++ Class Response**

```
class XLC_GenericCardConfigureAck : public
 XLC_OutboundMessage {
public:

 unsigned short getStatus() const
 void setStatus(unsigned short x)
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x)
 ;
};
```

# Generic Card Query 0x0123

---

**SwitchKit Name** GenericCardQuery

**Type** EXS API and SwitchKit API message

**Description** Use this message to query various card configuration settings.

**NOTE:** If you send too many TLVs in one message and exceed the allowable message length, you receive a Memory Allocation Failure NACK.

## DSP Series 2 Card

For the DSP Series 2 card, use this message to query the following:

- Card-level Defaults
- Alarm settings
- NFS location and Vocabulary Index File
- Sequence Number Size (8-bit or 16-bit)
- Advanced Conferencing Features
- T.30 Fax Parameters
- Echo Cancel Parameters

**Sent by** Host Application

**Related API Message** *Generic Card Configure*

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE reserved18[29];
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_GenericCardQuery;
```

## C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE reserved6[13];
 UBYTE TLVCount;
 UBYTE Data[250];
} XL_GenericCardQueryAck;
```

## C++ Class

```
class XLC_GenericCardQuery : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
```

```

void setDataType(UBYTE x);
UBYTE getTLVCount() const;
void setTLVCount(UBYTE x);
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x)
};

```

### C++ Class Response

```

class XLC_GenericCardQueryAck : public
 XLC_OutboundMessage {
public:

 unsigned short getStatus() const
 void setStatus(unsigned short x)
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x)
 ;

```

### EXS API Hex Format

| MESSAGE (White) |                                                                                                     | RESPONSE (Gray) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>    | <p>The Generic Event Logger (GEL) records system application and software debug events in the CSP. The GEL provides more debug data than the current fault log and online diagnostics.</p> <p>This message lets you control the Generic Event Logger (GEL). Every card that supports GEL has two buffers. One buffer stores LOGF/LOGB entries, and the other stores LOGT entries.</p> <p>LOGF enters seven data fields of ULONG type and an 80 character descriptor field to the LOGF/LOGB buffer. All data fields are user defined.</p> <p>LOGB puts a memory dump from a user defined address into the LOGF/LOGB buffer. The user also defines the size of the memory dump and a descriptive string of up to 20 characters.</p> <p>LOGT places a user-defined 20 character descriptive string into the LOGT buffer.</p> |

**NOTE:** This message is for debugging purposes only and should not be used until you contact technical support. Also, this message reduces system performance. **Cantata recommends using this message in test systems only.**

**Sent by** Host

**SwitchKit Code** **Configuration**

```
GELConfigQuery (
 Node = integer,
 Slot = integer,
 Action = integer,
 DataLength = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 UBYTE Slot;
 UBYTE Action;
 UBYTE DataLength;
 UBYTE Data[221];
} XL_GELConfigQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE Slot;
 UBYTE Data[221];
```

```
 } XL_GELConfigQueryAck;
```

### **C++ Class**

```
class XLC_GELConfigQuery : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### **C++ Class Response**

```
class XLC_GELConfigQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

**Response Status Continued Below**

If the message contains invalid fields, the CSP returns a NACK, but the following are some specific reasons for NACKs to this message. If you try to configure the logger or retrieve the buffer before pausing the logger, then the CSP responds with a NACK. This NACK specifies that the logger is not in a valid state.

The following NACKs are used:

- 0x14 Message Invalid for Current Matrix Controller State  
The Matrix Controller is not in a state to accept this message.
- 0x74 Invalid Card Type  
Incorrect card type for attempted operation.
- 0x20 Invalid Action Value  
Invalid decision parameter action value was received.
- 0x61 Invalid Slot  
The slot specified is not valid for the message sent.
- 0x99 Invalid Configuration Request  
Configuration request is invalid.
- 0x17 Invalid Data Type  
Returned in response to a message with invalid data parameters.

## Generic Report 0x0046

---

**SwitchKit Name** GenericReport

**Type** EXS API and SwitchKit API message

**Description** This message is generated in response to the following Query Types sent in the *System Configuration Query* message:

- 0x04 - Active Conference IDs
- 0x05 - Channel State
- 0x08 - DS1 Trunk MIB Report
- 0x0A - Resource Usage
- 0x0B - DS3 Trunk MIB Report
- 0x10 - Detailed Conference Information
- 0x13 - Conference Speakers
- 0x14 - Conferencing Features
- 0x15 - Child Conference Information
- 0x16 - Child Conference IDs
- 0x18 - Cache File Query

**NOTE:** The AIB and Number of Resources fields apply only if the Report Type field is Resource Usage (0x0A)

### In SwitchKit

If you want to get this report, you must register for it by calling the `sk_msgRegister` function with the parameter, `SK_RESOURCE_UTIL_REPORT`.

**Sent by** CSP

### Example Message (Socket Log Output for SwitchKit)

In the following socket log output/example message, the *Generic Report* contains resource usage data for Slot 9.

```
00 63 00 46 00 00 ff 0a 00 01 01 01 09 04 00 26 03 01 02 00
02 48 c0 00 00 01 c0 03 00 02 63 00 00 00 00 00 05 00
05 9e 00 00 03 26 00 05 00 08 8c 00 00 00 04 00 01 01
00 02 08 00 00 f4 84 01 00 5c 05 03 20 00 00 f4 84 09
00 5c 05 01 00 11 02 00 05 03 00 0f 04 01 30 05 00 34
06 00 47 07 00 26 32 04 3d
```

**Switchkit Code    C Structure**

```
typedef struct {
 UBYTE ReportType;
 UBYTE Data[252];
} XL_GenericReport;
```

**C++ Class**

```
class XLC_GenericReport : public XLC_InboundMessage {
public:
 UBYTE getReportType() const;
 void setReportType(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message**    The following table provides an overview of this message. The table following it provides the detail for each byte.

| MESSAGE (White)                                                                            |                                   | RESPONSE (Gray) |                       |

## 0x05 Channel State

Data 0–6 is an AIB indicating the first channel to be reported:

Data[0] Address Method (0x00) Individual AEs  
 Data[1] Number of Address Elements (0x01)  
 Data[2] Address Type (0x0D, Channel)  
 Data[3] Data Length (0x03)  
 Data[4] Logical Span ID, MSB  
 Data[5] Logical Span ID, LSB  
 Data[6] Channel

Data[7] Number of channels reported (1-32)

Data[8] First channel's current L4 state. (Repeated for each channel.)

The following are Layer 4 state values:

0x00 Out-of-Service  
 0x01 Incoming Call  
 0x02 Wait For CSA in Incoming Call State  
 0x03 In Service Idle  
 0x04 Incoming Call, Wait for L5  
 0x05 Outgoing Call, L3 Outseize Wait  
 0x06 Wait For CSA in Incoming Call Wait for Host State  
 0x07 Answered  
 0x08 L4 Clear ACK Wait, L3 Disconnect Received  
 0x09 L3 Clear Wait  
 0x0A Busied out  
 0x0B Outgoing Call Cut-thru  
 0x0C Wait for CSA in Incoming Alerted State  
 0x0D Wait for CSA in Incoming in Answered State  
 0x0E Incoming Call Alerted  
 0x0F L3 Clear Wait  
 0x10 Wait for CSA in Outgoing Cut-thru  
 0x11 Wait for CSA in Outgoing Alerted State  
 0x12 L4 Clear ACK Wait, L3 Clear Received  
 0x13 Outgoing Call Alerted  
 0x14 L4 Clear ACK Wait, L5 Clear Received  
 0x15 L5 Release Wait  
 0x16 Incoming Call, L4 Clear ACK Wait (Park Processing)  
 0x17 Incoming Call Alerted, L4 Clear ACK Wait (Park Processing)  
 0x18 Answered, L4 Clear ACK Wait (Park Processing)  
 0x19 Outgoing Alerted, L4 Clear ACK Wait (Park Processing)  
 0x1A Outgoing Cut-thru, L4 Clear ACK Wait (Park Processing)  
 0x1B Wait for CSA (Call Service Ack) for Internal Routing

Data[9] First channel's current L3 state as viewed by L4  
 (Repeated for each channel.)

The following are the Layer 3 state values relevant to Layer 4:

0x00 Out-of-Service  
 0x01 In Service  
 0x02 Maintenance  
 0x03 In Service Blocked  
 0x04 Unblocked

## 0x08 - DS1 Trunk MIB Report

Data 0-5 is an AIB:

Data[0] Address Method (0x00)  
Data[1] Number of Address Elements (0x01)  
Data[2] Address Type (0x0C)  
Data[3] Data Length (0x02)  
Data[4-5] Logical Span  
Data [6-9] Errored seconds  
Data [10-13] Severly errored seconds  
Data [14-17] Severly errored framing seconds  
Data [18-21] Unavailable seconds  
Data [22-25] Controlled slip seconds  
Data [26-29] Path code violations  
Data [30-33] Line code violations  
Data [34-37] Line errored seconds  
Data [38-41] Bursty errored seconds  
Data [42-45] Degraded minutes  
Data [46-49] Time elapsed  
Data [50-53] Interval number

## 0x0A Resource Usage

Resource ID 0x00 Memory

Data[0] Length  
Data[1] Number of regions configured on the card  
Data[2] Number of partitions configured on the card  
Data[3] Region ID of Nth region  
Data[4-7] Size of the region in bytes  
Data[8-11] Number of bytes used from the region  
Data [12] Partition ID of Nth partition  
Data[13-16] Size of the partition in bytes  
Data[17-20] Used bytes of partition  
:  
Data[:] Region ID of Nth region(1 byte)  
Data[:] Size of the Nth region in bytes (4 bytes)  
Data[:] Number of bytes used from the Nth region(4 bytes)  
Data [:] Partition ID of 1st partition (1 byte)  
Data[:] Size of the 1st partition in bytes (4 bytes)  
Data[:] Used bytes of 1st partition (4 bytes)  
:  
Data [:] Partition ID of Nth partition (1 byte)  
Data[:] Size of the Nth partition in bytes (4 bytes)  
Data[:] Used bytes of Nth partition (4 bytes)

Resource ID 0x01 MCB

Data[0] Length  
Data[0] Message buffer usage

Resource ID 0x02 CPU Usage Level 1

Data[0] Length  
Data[1-4] Time in milliseconds covering this report  
Data[5] Number of tasks reported  
Data[6] Logical task ID (idle task only 0x00)  
Data[7] Percentage of time usage for task (integer part)  
Data[8] Percentage of time usage for task (decimal part)

## Resource ID 0x03 CPU Usage Level 2

Data[0] Length  
 Data[1-4] Time in milliseconds covering this report  
 Data[5] Number of tasks reported  
 Data[6] Logical task ID  
 Data[7] Percentage of time usage for task (integer part)  
 Data[8] Percentage of time usage for task (decimal part)

## 0x0B DS3 Trunk MIB Report Type

Data 0-5 is an AIB:

Data[0] Address Method (0x00)  
 Data[1] Number of Address Elements (0x01)  
 Data[2] Address Type (0x32)  
 Data[3] Data Length (0x02)  
 Data[4] Slot Number  
 Data[5] DS3 Offset

Data[6] Alarm Status

A bit mask indicating what alarm is being sent and received on the DS3:

Bit 0: Receiving Red  
 Bit 1: Receiving RAI  
 Bit 2: Receiving Loss of Signal (LOS)  
 Bit 3: Receiving Out of Frame (OOF)  
 Bit 4: Receiving AIS  
 Bit 5: Sending AIS  
 Bit 6: Sending RAI  
 Bit 7: Reserved

Data[7-10] Code Violations – Near End – Line (CV-L)

Data[11-14] Errored Seconds – Near End – Line (ES-L)

Seconds containing one or more BPVs or EXZs defects.

Data[15-18] Severely Errored Seconds – Near End - Line (SES-L)

Seconds during which BPVs plus EXZs exceed 44.

Data[19-22] Code Violations – Near End – Path (CVP-P)

Data[23-26] Errored Seconds – Near End – Path (ESP-P)

Seconds containing one or more p-bit parity errors or SEF defects

Data[27-30] Severely Errored Seconds – Near End -Path (SESP-P)

Seconds during which p-bit parity errors exceed 44 or one or more SEF defects

Data[31-34] Unavailable Seconds – Near End - Path (UASP-P)

Data[35-38] Code Violations – Near End - Path (CVCP-P)

Data[39-42] Errored Seconds – Near End – Path (ESCP-P)

Seconds containing one or more c-bit parity errors or SEF defects.

Data[43-46] Severely Errored Seconds – Near End - Path (SESCP-P)

Seconds during which c-bit parity errors exceed 44 or one or more SEF defects.

Data[47-50] Unavailable Seconds – Near End - Path (UASCP-P)

Data[51-54] SEF/AIS Seconds – Near End –Path (SAS-P)

Seconds containing one or more SEF defects.

Data[55-58] Code Violations – Far End – Path (CVCP-PFE)

Data[59-62] Errored Seconds – Far End – Path (ESCP-PFE)

Data[63-66] Severely Errored Seconds – Far End - Path (SESCP-PFE)

Data[67-70] Unavailable Seconds – Far End – Path (UASCP-PFE)

Data[71-74] SEF/AIS Seconds – Far End – Path (SASCP-PFE)

Data[75-78] Time Elapsed since the counters were last cleared

Data[79-82] Interval Number (number of reports sent including this one)

| Data[26-29]   | Speaker #3 Active Speaking Time (5 ms increments) |

## 0x13 Conference Speakers (Child Conference)

If conference speaker information is queried for child conference, the report data will be in the following format.

Data[0-7] Child Conference ID AIB  
 Data[8-9] Speaker #1 Span  
 Data[10] Speaker #1 Chan  
 Data[11] Speaker #1 Energy Level (dBm)  
 Data[12-15] Speaker #1 Active Speaking Time  
 Data[16-17] Speaker #2 Span  
 Data[18] Speaker #2 Chan  
 Data[19] Speaker #1 Energy Level (dBm)  
 Data[20-23] Speaker #2 Active Speaking Time  
 Data[24-25] Speaker #3 Span  
 Data[26] Speaker #3 Chan  
 Data[27] Speaker #1 Energy Level (dBm)  
 Data[28-31] Speaker #3 Active Speaking Time

## 0x14 Conferencing Features (Parent Conference)

If a conference ID is queried, the Report data is in the following format:

Data[0-5] Conference ID AIB  
 Data[6-7] DTMF Clamping Enabled  
 Data[8-9] Output Gain  
 Data[10-11] Noise Gating Enabled  
 Data[12-13] Noise Gating Time Constant  
 Data[14-15] Max Noise Level  
 Data[16-17] Noise Gating Sensitivity  
 Data[18-19] Echo Suppression Enable  
 Data[20-21] Echo Return Loss  
 Data[22-23] AGC Enable  
 Data[24-25] AGC Input Level  
 Data[26-27] AGC Time Constant  
 Data[28-29] Conference Failure Behavior  
 Data[30-31] Transit Connection Mode

If a channel is queried the Report data is in the following format:

Data[0-6] Channel AIB  
 Data[7-8] DTMF Clamping Enabled  
 Data[9-10] Output Gain  
 Data[11-12] Noise Gating Enabled  
 Data[13-14] Noise Gating Time Constant  
 Data[15-16] Max Noise Level  
 Data[17-18] Noise Gating Sensitivity  
 Data[19-20] Echo Suppression Enable  
 Data[21-22] Echo Return Loss  
 Data[23-24] AGC Enable  
 Data[25-26] AGC Input Level  
 Data[27-28] AGC Time Constant  
 Data[29-30] Conference Failure Behavior  
 Data[31-32] Channel Input Gain

## 0x14 Conferencing Features (Child Conference)

If parameters are queried for child conference, the report data will be in the following format.

Data[0-7] Child Conference ID AIB  
Data[8-9] DTMF Clamping Enabled  
Data[10-11] Output Gain  
Data[12-13] Noise Gating Enabled  
Data[14-15] Noise Gating Time Constant  
Data[16-17] Max Noise Level  
Data[18-19] Noise Gating Sensitivity  
Data[20-21] Echo Suppression Enable  
Data[22-23] Echo Return Loss  
Data[24-25] AGC Enable  
Data[26-27] AGC Input Level  
Data[28-29] AGC Time Constant  
Data[30-31] Conference Failure Behavior

If parameters are queried for a particular channel connected to a conference/child conference, the report data will be in the following format.

Data[0-6] Channel AIB  
Data[7-8] DTMF Clamping Enabled  
Data[9-10] Output Gain  
Data[11-12] Noise Gating Enabled  
Data[13-14] Noise Gating Time Constant  
Data[15-16] Max Noise Level  
Data[17-18] Noise Gating Sensitivity  
Data[19-20] Echo Suppression Enable  
Data[21-22] Echo Return Loss  
Data[23-24] AGC Enable  
Data[25-26] AGC Input Level  
Data[27-28] AGC Time Constant  
Data[29-30] Conference Failure Behavior  
Data[31-32] Channel Input Gain

| <b>Type</b>        | SwitchKit API message                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | This message reports the status of LLC entities to applications that have registered for it. In particular it will report the status of the LLC socket connections, LLC to LLC redundancy status, and the service state of channels groups being watched by an application.                                                                                                               |
| <b>Sent by</b>     | LLC to applications that have registered for it using the SK_msgRegister() function with the parameter SK_GENERIC_LLC_REPORT.                                                                                                                                                                                                                                                             |
| <b>C Structure</b> | <pre>typedef struct {     unsigned short DataSize;     UBYTE ReportType;     UBYTE TLVCount;     UBYTE Data[249]; } <b>SK_GenericLLCReport</b>;</pre>                                                                                                                                                                                                                                     |
| <b>C++ Class</b>   | <pre>class <b>SKC_GenericLLCReport</b> : public SKC_ToolkitMessage { public:     unsigned short getDataSize() const;     void setDataSize(unsigned short x);     UBYTE getReportType() const;     void setReportType(UBYTE x);     UBYTE getTLVCount() const;     void setTLVCount(UBYTE x);     const UBYTE *getData() const;     UBYTE *getData();     void setData(UBYTE *x); };</pre> |
| <b>Arguments</b>   | The following table shows the arguments sent by the LLC:                                                                                                                                                                                                                                                                                                                                  |

| Argument   | Description                  |
|------------|------------------------------|
| DataSize   | Number of bytes of the data. |
| ReportType | Type of GenericLLCReport     |
| TLVCount   | Number of TLVs in the data.  |
| data       | Data bytes                   |

## Report Types

The following report types are used in the *GenericLLCReport* message.

| Report Type             | Value                     |
|-------------------------|---------------------------|
| SK_NSR_CHANGE           | 0x01 (not currently used) |
| SK_NSQ_CHANGE           | 0x02 (not currently used) |
| SK_PM_CHANGE            | 0x03                      |
| SK_SOCKET_CHANGE        | 0x04 (not currently used) |
| SK_SSC_UPDATE           | 0x05                      |
| SK_LINK_UP              | 0x06                      |
| SK_LINK_DOWN            | 0x07                      |
| SK_GROUP_WATCHER_STATUS | 0x08                      |
| SK_CHANNEL_RANGE_STATUS | 0x09                      |
| SK_LL_C_REDUNDANCY      | 0x0b                      |

**TLVs** Several different TLVs can be reported within the *GenericLLCReport*:

- SK\_LL\_C\_REDSTATE\_TLV (0x0004)
- SK\_LL\_C\_REDSTATE\_TLV (0x0005)
- SK\_LL\_C\_REDSETTINGS\_TLV (0x0006)
- SK\_POLL\_DATA\_TLV (0x1000)
- Sk\_IPV4\_TLV (0x1001)
- SK\_ROUTING\_TLV (0x1002)
- Sk\_LNI\_TLV (0x1003)
- SK\_CHANNEL\_GROUP\_TLV (0x1004)
- SK\_CHANNEL\_RANGE\_TLV (0x1005)

### Report Type: SK\_LL\_C\_REDUNDANCY

A GenericLLCReport of report type, SK\_LL\_C\_REDUNDANCY is generated and sent to registered applications by the active LLC when:

- An application connects
- The LLC changes redundancy states
- An *LLCQuery* of type SK\_LL\_C\_REDUNDANCY\_QUERY\_TLV is sent to the active LLC.

The standby LLC sends reports under the same circumstances. However, because only the active LLC can communicate with the

standby LLC, the primary LLC (PLLC) to redundant LLC (RLLC) link must be in SK\_LINK\_UP state for the application to receive the reports. If the PLLC to RLLC link is in state SK\_LINK\_DOWN, no responses from the standby LLC will be seen.

### Possible TLV Combinations

| Report Type       | LLCREDTYPE_TLV | LLCREDSTATE_TLV | LLCREDSETTINGS_TLV |
|-------------------|----------------|-----------------|--------------------|
| SK_LLC_Redundancy | 1              | 1               | 1                  |

**TLV Syntax** The TLVs described in this section are used with the SK\_LLC\_REDUNDANCY report type in a *GenericLLCReport* message.

- SK\_LLCREDTYPE\_TLV (0x0004)
- SK\_LLCREDSTATE\_TLV (0x0005)
- SK\_LLCREDSETTINGS\_TLV (0x0006)

**SK\_LLCCREDTYPE\_TLV (0x0004)**

| Description | Byte (Value)                                                                                             |
|-------------|----------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x0004 (SK_LLCCREDTYPE_TLV)                                                                 |
| Length      | Data[2, 3] = 0x0001                                                                                      |
| Value       | Data[4] = Type<br><br>0x01 - LLC was started as primary<br>0x02 - LLC was started as redundant (with -r) |

**SK\_LLCCREDSTATE\_TLV (0x0005)**

| Description | Byte (Value)                                                                                                                                                                                                                                                            |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x0005 (SK_LLCCREDSTATE_TLV)                                                                                                                                                                                                                               |
| Length      | Data[2, 3] = 0x0002                                                                                                                                                                                                                                                     |

### Report Types

The TLVs in this section are used to report the status of the LLC socket connections.

- SK\_PM\_CHANGE
- SK\_SSC\_UPDATE
- SK\_LINK\_UP
- SK\_LINK\_DOWN

These report types are unsolicited messages that report the status of socket connections between the LLC and its devices, in particular, devices that share a logical node but are on unique logical links (i.e. direct connections to the SS7 for TCAP).

The following list describes the conditions that will cause the LLC to send these reports within the GenericLLCReport:

- **SK\_PM\_CHANGE**  
Sent when the first poll is received by the LLC for a Matrix Controller. Also sent any time a value changes in the Poll. The UpdatedFieldBits field indicates which fields have changed since the last poll.
- **SK\_SSC\_UPDATE**  
Sent when an application issues an AddLLCCard. An SSC\_UPDATE may be generated if the LLC already knew about the device and the LLC is currently connected to the active device within that node. In other words, if the Link is considered to be up.
- **SK\_LINK\_UP**  
Sent to indicate that there is a connection to the active device for this node and the device is ready to be configured. This will be sent if this is a new condition (i.e. the LLC was not previously connected to the active Device).
- **SK\_LINK\_DOWN**  
Sent to indicate that there is NO connection to the active Device for a node. This will be sent if this is a new condition (that is, we were previously connected to the active Device).

**Important!** Performing an AddLLCCard will result in an SK\_SSC\_UPDATE with the last poll from the active Device, if the LLC is currently connected to the Device in the active state.

**SK\_POLL\_DATA\_TLV (0x1000)**

| Description | Byte (Value)                                                                                                                                                                                                                    |

**SK\_ROUTING\_TLV (0x1002)**

| Description | Byte (Value)                         |
|-------------|--------------------------------------|
| Tag         | Data[0, 1] = 0x1002 (SK_ROUTING_TLV) |
| Length      | Data[2, 3] = 0x0004                  |
| Value       | Data[4,5,6,7] = Routing ID           |

**SK\_LNI\_TLV (0x1003)**

| Description | Byte (Value)                          |
|-------------|---------------------------------------|
| Tag         | Data[0, 1] = 0x1003 (SK_LNI_TLV)      |
| Length      | Data[2, 3] = 0x0002                   |
| Value       | Data[4,5] = Requested Logical Node ID |

## Report Types

The TLVs in this section are used to report the service state of channel groups being watched by an application.

- SK\_GROUP\_WATCHER\_STATUS
- SK\_CHANNEL\_RANGE\_STATUS

| Report Type             | SK_CHANNEL_GROUP_TLV | SK_CHANNEL_RANGE_TLV |
|-------------------------|----------------------|----------------------|
| SK_GROUP_WATCHER_STATUS | 1                    |                      |
| SK_CHANNEL_RANGE_STATUS |                      | 1                    |

### SK\_CHANNEL\_GROUP\_TLV (0x1004)

In the event that the environment variable SK\_CHANNEL\_RECOVERY\_METHOD=0x03 (All\_OUT\_OF\_SERVICE) is set or a *ForceGroupState* message is received, the LLC has the ability to take entire groups of channels in-service and out-of-service. In the event that this occurs a "master" application can be created that monitors this behavior by registering for GenericLLCReports and parsing a new report type within it called SK\_GROUP\_WATCHER\_STATUS.

| Description | Byte (Value)                                                                                                                                    |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x1004<br>(SK_CHANNEL_GROUP_TLV)                                                                                                   |
| Length      | Data[2, 3] = 0x0034                                                                                                                             |
| Value       | Data[4] = Status<br><br>0x00 Not Watched<br>0x01 Watched<br><br>Data[5] Reserved (Not Used)<br><br>Data [6,56] = Group (null terminated string) |

### SK\_CHANNEL\_RANGE\_TLV (0x1005)

In the event that the environment variable SK\_CHANNEL\_RECOVERY\_METHOD=0x03 (All\_OUT\_OF\_SERVICE) is set or a *ForceGroupState* message is

received, the LLC has the ability to take entire groups of channels in-service and out-of-service. In the event that this occurs a "master" application can be created that monitors this behavior by registering for GenericLLCReports and parsing a new report type within it called SK\_CHANNEL\_RANGE\_STATUS.

| Description | Byte (Value)                                                                                                                                                                                                         |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x1005<br>(SK_CHANNEL_RANGE_TLV)                                                                                                                                                                        |
| Length      | Data[2, 3] = 0x0009                                                                                                                                                                                                  |
| Value       | Data[4,5] = Start Span<br>Data[6] = Start Channel<br>Data[7,8] = End Span<br>Data[9] = End Channel<br>Data[10] = Status<br><br>0xF0 SK_IN_SERVICE<br>0x0F SK_OUT_OF_SERVICE<br><br>Data[11,12] = Reserved (Not Used) |

#### Possible TLV Combinations

| Report Type   | SK_LNI_TLV | SK_POLL_DATA_TLV | SK_IPV4_TLV |
|---------------|------------|------------------|-------------|
| SK_PM_CHANGE  | 1          | 1                | 1           |
| SK_SSC_UPDATE | 1          | 1                | 1           |
| SK_LINK_UP    | 1          | 0                | *           |
| SK_LINK_DOWN  | 1          | 0                | **          |

\* A Report Type will contain at least one of these TLVs. The matrix controller represented by the first TLV in a series will always indicate the current Active.

\*\* A Report Type will contain at least one of these TLVs. When a series of TLVs is sent by the LLC, the order of the TLVs is irrelevant. When the link is down the LLC does not know which is Active or not.

# HexTool

---

**Type** SwitchKit API message

**Purpose** Use the ***SK\_HexTool*** message to send a configuration file directly to a specific slot in a node.

**Description** This message sends a config file containing EXS API to a specific slot. The \*.cfg file is resent whenever required, based on the configuration setting for the card in the designated slot.

**Sent by** CSA or SwitchManager

**Arguments** The following table shows the user modifiable arguments of this message:

| Arguments   | Descriptions                                                                                   |
|-------------|------------------------------------------------------------------------------------------------|
| Slot        | The slot number the file is destined for.                                                      |
| CfgFile     | The filename of the file to parse and send. The maximum size of the CfgFile name is 160 bytes. |
| CSAFilename | Internally used by CSA.                                                                        |

**Configuration** ***HexTool*** (  
Node = integer,  
Slot = integer,  
CfgFile = quoted string  
ConnectionID = integer);

**C Structure** typedef struct {  
    UBYTE Slot;  
    char CfgFile[100];  
    char CSAFilename[100];  
} ***SK\_HexTool***;

**C++ Class** class ***SKC\_HexTool*** : public SKC\_DummyMessage {  
public:  
    UBYTE getSlot() const;  
    void setSlot(UBYTE x);  
    const char \*getCfgFile() const;  
    void setCfgFile(const char \*x);  
    const char \*getCSAFilename() const;  
    void setCSAFilename(const char \*x);  
};

# HostAlarm

---

**Type** SwitchKit API message

**Description** Use the *SK\_HostAlarm* message to allow SwitchKit applications to generate alarms or events that can be sent to other SwitchKit applications. Receiving applications, such as SNMP processes will be able to register to receive this class of message.

**Sent by** Application

**Arguments** The following table shows the arguments you can change:

| Argument       | Description                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| AppName        | A text string used to uniquely identify the application sending the message. (ASCII String 64 characters maximum) |
| AlarmTime      | This is the number of seconds since January 1 1970.                                                               |
| IPAddrofSender | This field will contain the IP Address of the host system where the problem originated                            |
| AlarmMajor     | See Table 1:Alarm Types                                                                                           |
| AlarmSubType   | See Table 2: Alarm Sub-types/Probable Cause                                                                       |
| AlarmSeverity  | See Table 3:Alarm Severity                                                                                        |
| TLVCount       | The number of data items associated with this message                                                             |
| TLVData        | SeeTable 4: TLV Data Types                                                                                        |

**Configuration** Syntax, if able to send, is through SMgr

**C Structure**

```
typedef struct {
 UBYTE IPAddrofSenderSize;
 UBYTE reserved5[12];
 char AppName[64];
 int AlarmTime;
 UBYTE IPAddrofSender[4];
 UBYTE AlarmMajor;
```

```

 UBYTE AlarmSubType;
 UBYTE AlarmSeverity;
 UBYTE TLVCount;
 UBYTE TLVData[177];
} SK_HostAlarm;

```

**C Structure Response**

```

typedef struct {
 int Status;
 UBYTE reserved21[4];
} SK_HostAlarmAck;

```

**C++ Class**

```

class SKC_HostAlarm : public SKC_ToolkitMessage {
public:
 UBYTE getIPAddrOfSenderSize() const;
 void setIPAddrOfSenderSize(UBYTE x);
 const char *getAppName() const;
 void setAppName(const char *x);
 int getAlarmTime() const;
 void setAlarmTime(int x);
 const UBYTE *getIPAddrOfSender() const;
 UBYTE *getIPAddrOfSender();
 void setIPAddrOfSender(UBYTE *x);
 UBYTE getAlarmMajor() const;
 void setAlarmMajor(UBYTE x);
 UBYTE getAlarmSubType() const;
 void setAlarmSubType(UBYTE x);
 UBYTE getAlarmSeverity() const;
 void setAlarmSeverity(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getTLVData() const;
 UBYTE *getTLVData();
 void setTLVData(UBYTE *x);
};

```

**C++ Class Response**

```

class SKC_HostAlarmAck : public SKC_ToolkitAck {
public:
 int getStatus() const
 void setStatus(int x)
};

```

**Table 1:Alarm Types**

| Name                      | Value as Defined    | Description                                                                                                                                    |
|---------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Communications Alarm Type | SK_COMMUNICATIONS 1 | An alarm of this type is principally associated with the procedures and/or processes required to convey information from one point to another. |

| Name                        | Value as Defined      | Description                                                                                                                 |
|-----------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| QOS Alarm Type              | SK_QUALITYOFSERVICE 2 | An alarm of this type is principally associated with degradation in the quality of a service.                               |
| Processing Error Alarm Type | SK_PROCESSINGERROR 3  | An alarm of this type is principally associated with a software or processing fault.                                        |
| Equipment Alarm Type        | SK_EQUIPMENT 4        | An alarm of this type is principally associated with an equipment fault                                                     |
| Environmental Alarm Type    | SK_ENVIRONMENTAL 5    | An alarm of this type is principally associated with a condition relating to an enclosure in which the equipment resides.it |

**Table 2: Alarm Sub-types/Probable Cause**

| Name                             | Value as Defined                   | Description                                                                                                                                                                              |
|----------------------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adapter error                    | SK_ADAPTERERROR 1                  |                                                                                                                                                                                          |
| Application subsystem failure:   | SK_APPLICATIONSUBSYSTEMFAILURE 2   | A failure in an application subsystem has occurred (an application subsystem may include software to support the Session, Presentation or Application layers)                            |
| Bandwidth reduced                | SK_BANDWIDTHREDUCED 3              | The available transmission bandwidth has decreased                                                                                                                                       |
| Call establishment error         | SK_CALLESTABLISHMENTERROR 4        | An error occurred while attempting to establish a connection                                                                                                                             |
| Communications protocol error    | SK_COMMUNICATIONPROTOCOLERROR 5    | A communication protocol has been violated                                                                                                                                               |
| Communications subsystem failure | SK_COMMUNICATIONSUBSYSTEMFAILURE 6 | A failure in a subsystem that supports communications over telecommunications links, these may be implemented via leased telephone lines, by X.25 networks, token-ring LAN, or otherwise |

| Name                                  | Value as Defined                       | Description                                                                                                                                                                                            |
|---------------------------------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration or customization error: | SK_CONFIGURATIONORCUSTOMIZATIONERROR 7 | A system or device generation or customization parameter has been specified incorrectly, or is inconsistent with the actual configuration                                                              |
| Congestion:                           | SK_CONGESTION 8                        | A system or network component has reached its capacity or is approaching it                                                                                                                            |
| Corrupt data:                         | SK_CORRUPTDATA 9                       | An error has caused data to be incorrect and thus unreliable                                                                                                                                           |
| CPU cycles limit exceeded             | SK_CPUCYCLESLIMITEXCEEDED 10           | A Central Processing Unit has issued an unacceptable number of instructions to accomplish a task                                                                                                       |
| Dataset or modem error                | SK_DATASETORMODEMERROR 11              | An internal error has occurred on a dataset or modem                                                                                                                                                   |
| Degraded signal                       | SK_DEGRADED SIGNAL 12                  | The quality or reliability of transmitted data has decreased                                                                                                                                           |
| DTE-DCE interface error:              | SK_DTEDCEINTERFACEERROR 13             | A problem in a DTE-DCE interface, which includes the interface between the DTE and DCE, any protocol used to communicate between the DTE and DCE and information provided by the DCE about the circuit |
| Enclosure door open                   | SK_ENCLOSUREDOOROPEN 14                |                                                                                                                                                                                                        |
| Equipment malfunction                 | SK_EQUIPMENTMALFUNCTION 15             | An internal machine error has occurred for which no more specific Probable cause has been identified                                                                                                   |

| Leak detected:                                 | SK_LEAKDETECTED 26                   | A leakage of (non-toxic) fluid or gas has been detected                                                  |
| Local node transmission<br>error:              | SK_LOCALNODETRANSMISSIONER<br>ROR 27 | An error occurred on a communications channel between the local node and an adjacent node                |
| Loss of frame                                  | SK_LOSSOFFRAME 28                    | An inability to locate the information that delimits the bit grouping within a continuous stream of bits |
| Loss of signal                                 | SK_LOSSOFSIGNAL 29                   | An error condition in which no data is present on a communications circuit or channel                    |
| Material supply<br>exhausted                   | SK_MATERIALSUPPLYEXHAUSTED<br>30     | A supply of needed material has been exhausted                                                           |
| Multiplexer problem                            | SK_MULTIPLEXERPROBLEM 31             | An error has occurred while multiplexing communications signals                                          |
| Out of memory                                  | SK_OUTOFMEMORY 32                    | There is no program-addressable storage available.                                                       |
| Output device error                            | SK_OUTPUTDEVICEERROR 33              | An error has occurred on the output device                                                               |
| Performance degraded                           | SK_PERFORMANCEDEGRADED<br>34         | Service agreements or service limits are outside of acceptable limits                                    |

| Name                                   | Value as Defined                             | Description                                                                                                                |
|----------------------------------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Power problem                          | SK_POWERPROBLEM 35                           | There is a problem with the power supply for one or more resources                                                         |
| Pressure unacceptable                  | SK_PRESSUREUNACCEPTABLE 36                   | A fluid or gas pressure is not within acceptable limits                                                                    |
| Processor problem                      | SK_PROCESSORPROBLEM 37                       | An internal machine error has occurred on a Central Processing Unit                                                        |
| Pump failure                           | SK_PUMPFailure 38                            | Failure of mechanism that transports a fluid by inducing pressure differentials within the fluid                           |
| Queue size exceeded                    | SK_QUEUE_SIZE_EXCEEDED 39                    | The number of items to be processed (configurable or not) has exceeded the maximum allowable                               |
| Receive failure                        | SK_RECEIVEFAILED 40                          |                                                                                                                            |
| Receiver failure                       | SK_RECEIVERFAILED 41                         |                                                                                                                            |
| Remote node transmission error         | SK_REMOTE_NODE_TRANSMISSION_ERROR 42         | An error occurred on a communication channel beyond the adjacent node                                                      |
| Resource at or nearing capacity        | SK_RESOURCE_AT_OR_NEARING_CAPACITY 43        | The usage of a resource is at or nearing the maximum allowable capacity                                                    |
| Response time excessive                | SK_RESPONSE_TIME_EXCESSIVE 44                | The elapsed time between the end of an inquiry and beginning of the answer to that inquiry is outside of acceptable limits |
| Retransmission rate excessive          | SK_RETRANSMISSION_RATE_EXCESSIVE 45          | The number of repeat transmissions is outside of acceptable limits                                                         |
| Software error                         | SK_SOFTWARE_ERROR 46                         | A software error has occurred for which no more specific Probable cause can be identified                                  |
| Software program abnormally terminated | SK_SOFTWARE_PROGRAM_ABNORMALLY_TERMINATED 47 | A software program has abnormally terminated due to some unrecoverable error condition                                     |
| Software program error                 | SK_SOFTWARE_PROGRAM_ERROR 48                 | An error has occurred within a software program that has caused incorrect results                                          |
| Storage capacity problem               | SK_STORAGE_CAPACITY_PROBLEM 49               | A storage device has very little or no space available to store additional data                                            |

| Name                            | Value as Defined                    | Description                                                                                                                                         |
|---------------------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Temperature unacceptable        | SK_TEMPERATUREUNACCEPTABLE 50       | A temperature is not within acceptable limits                                                                                                       |
| Threshold crossed               | SK_THRESHOLDCROSSED 51              | A limit (configurable or not) has been exceeded                                                                                                     |
| Timing problem                  | SK_TIMINGPROBLEM 52                 | A process that requires timed execution and/or coordination cannot complete, or has completed but cannot be considered reliable                     |
| Toxic leak detected             | SK_TOXICLEAKDETECTED 53             | A leakage of toxic fluid or gas has been detected                                                                                                   |
| Transmit failure                | SK_TRANSMITFAILURE 54               |                                                                                                                                                     |
| Transmitter failure             | SK_TRANSMITTERFAILURE 55            |                                                                                                                                                     |
| Underlying resource unavailable | SK_UNDERLYINGRESOURCEUNAVAILABLE 56 | An entity upon which the reporting object depends has become unavailable                                                                            |
| Version mismatch                | SK_VERSIONMISMATCH 57               | There is a conflict in the functionality of versions of two or more communicating entities which may affect any processing involving those entities |
| License verification failure    | SK_LICENSE 58                       | A node's license verification failed.                                                                                                               |
| Node in use                     | SK_NODE_IN_USE 59                   | An attempt was made to add a duplicate node to the LLC's node list.                                                                                 |
| Node created                    | SK_NODE_CREATED 60                  | A node was added to the LLC's node list. Initiates a severity level of SK_INFORMING.                                                                |
| Node removed                    | SK_NODE_REMOVED 61                  | A node was removed from the LLC's node list. Initiates a severity level of SK_INFORMING                                                             |

**Table 3: Alarm Severity**

| <b>Name</b>   | <b>Value as Defined</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cleared       | SK_CLEARED 1            | The Cleared severity level indicates the clearing of one or more previously reported alarms. This alarm clears all alarms for this managed object that have the same Alarm type, Probable cause and Specific problems (if given). Multiple associated notifications may be cleared by using the Correlated notifications parameter (defined below).              |
| Indeterminate | SK_INDETERMINATE 2      | The Indeterminate severity level indicates that the severity level cannot be determined.                                                                                                                                                                                                                                                                         |
| Major         | SK_MAJOR 5              | The Major severity level indicates that a service affecting condition has developed and an urgent corrective action is required. Such a severity can be reported, for example, when there is a severe degradation in the capability of the managed object and its full capability must be restored.                                                              |
| Critical      | SK_CRITICAL 6           | The Critical severity level indicates that a service affecting condition has occurred and an immediate corrective action is required. Such a severity can be reported, for example, when a managed object becomes totally out of service and its capability must be restored.                                                                                    |
| Minor         | SK_MINOR 4              | The Minor severity level indicates the existence of a non-service affecting fault condition and that corrective action should be taken in order to prevent a more serious (for example, service affecting) fault. Such a severity can be reported, for example, when the detected alarm condition is not currently degrading the capacity of the managed object. |
| Warning       | SK_WARNING 3            | The Warning severity level indicates the detection of a potential or impending service affecting fault, before any significant effects have been felt. Action should be taken to further diagnose (if necessary) and correct the problem in order to prevent it from becoming a more serious service-affecting fault.                                            |

**Table 4: TLV Data Types**

| <b>Name</b>   | <b>Value as Defined</b> | <b>Description</b>                                                                                            |
|---------------|-------------------------|---------------------------------------------------------------------------------------------------------------|
| DisplayString | SK_TLV_DISPLAYSTRING 1  | ASCII text string. Characters greater than or equal to 0x20 and characters less than 0x7e, 64 characters max. |
| Integer       | SK_TLV_INTEGER 2        | Integer field                                                                                                 |

| Name            | Value as Defined         | Description                                                                                                                               |
|-----------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| IpAddress       | SK_TLV_IPADDRESS 3       | This application-wide type represents a 32-bit internet address. It is represented as an OCTET STRING of length 4, in network byte-order. |
| PhysicalAddress | SK_TLV_PHYSICALADDRESS 4 | This data type is used to model media addresses. For example, an ethernet address would be represented as a string of 6 octets.           |

| <b>Description</b>                                       | <p>The <i>Inpulsing Parameters Configure</i> message allows the host to configure impulse data collection parameters on specified channels. Use impulse parameters when data is collected by means of an <i>Inseize Control</i> instruction. Call setup inpulsing parameters define the address signaling type, number of digit strings, and collection method used during call setup.</p> <p>The CSP supports four different inpulsing stages, and each stage is defined as either one or two digit strings. When instructing the CSP to collect address signaling information that is typically presented with in-band dual frequency tones, the host must specify a preprogrammed inpulsing stage that describes how to perform the digit collection.</p> <p>Each channel has four inpulsing stages that can be preprogrammed. The inpulsing stage configuration options include: the address signaling type (DTMF, MFR1, MFR2), the number of strings (1 or 2), and the string collection method (fixed number digits, KP/ST framed, compelled).</p> |
| <b>Sent by</b>                                           | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Example Message (Socket Log Output for SwitchKit)</b> | <p>The following socket log output/example message shows data being sent from the host to the CSP to configure impulse data collection parameters on span 0x00, channels 0x00 - 0x17. The stage number being configured is 0x01 and the number of digit strings in the stage is 0x01. The stage complete timeout is three seconds and the address signaling type is DTMF. This message collects seven digits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Default Impulse Parameters

The number of strings for each stage for each span listed below is 1.

### T1 Spans

The information for each stage is identical.

#### Stages 1–4

|                        |                                                    |
|------------------------|----------------------------------------------------|
| Stage Complete Timer   | 12,000 ms                                          |
| Address Signaling Type | MFR1                                               |
| Collection Method      | Use KP_ST, KP, and ST digits not reported to host. |

### E1 Spans

#### Stage 1

|                        |                  |
|------------------------|------------------|
| Stage Complete Timer   | 12,000 ms        |
| Address Signaling Type | MFR2             |
| Collection Method      | Compelled        |
| Collection Data        | 0x03 (Area Code) |

#### Stage 2

|                        |                             |
|------------------------|-----------------------------|
| Stage Complete Timer   | 12,000 ms                   |
| Address Signaling Type | MFR2                        |
| Collection Method      | Compelled                   |
| Collection Data        | 0x0A (CLI, Calling Line ID) |

#### Stage 3

|                        |                             |
|------------------------|-----------------------------|
| Stage Complete Timer   | 12,000 ms                   |
| Address Signaling Type | MFR2                        |
| Collection Method      | Compelled                   |
| Collection Data        | 0x07 (Called Party Address) |

#### Stage 4

|                        |                               |
|------------------------|-------------------------------|
| Stage Complete Timer   | 12,000 ms                     |
| Address Signaling Type | MFR2                          |
| Collection Method      | Compelled                     |
| Collection Data        | 0x01 (Group 2 Category Digit) |

# Inpulsing Parameters Query 0x0089

---

|                       |                                                                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SwitchKit Name</b> | InpulsingParametersQuery                                                                                                                                                                                                                |
| <b>Type</b>           | EXS API and SwitchKit API message                                                                                                                                                                                                       |
| <b>Description</b>    | This host uses this message to query the inpulsing parameters configured on the specified channel. The response from the CSP reports four two-string stages, even if there is no configuration for a stage (which is reported as 0x00). |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                    |

| <b>Description</b>      | <p>Use this message to control incoming call setup during real-time call processing on a specified channel. Instructions and data are passed in this message in the form of Information Control Blocks (ICBs).</p> <p>You can preprogram a list of instructions using the <i>Inseize Instruction List Configure</i> message and initiate them by sending the <i>Inseize Control</i> message with an ICB of “Use Instruction List”.</p> <p>The system does not replace the default instruction list with the list you specify with the “Use Instruction List” ICB. The system concatenates the list you specify in this message to the default list.</p> <p>An instruction that is not carried out is reported via a negative acknowledgment. A positive acknowledgment is reported only if you include a “Send Host Acknowledgment” Action ICB in the message.</p> |

| <b>Description</b>      | <p>Use several of these messages to form a list of configuration instruction for inseize control. You must send a separate <i>Inseize Instruction List Configure</i> message for each instruction that you add to the list.</p> <p>After configuring a channel with an inseize instruction list, the CSP executes the list upon detecting an inseizure on the channel.</p> <p>The last instruction in a list should always be “Wait For Host Control” or “Wait for Host Control with Answer Supervision,” where the CSP waits for further instructions from the host to continue processing.</p> <p><b>NOTE:</b> A seize instruction <i>cannot</i> be preprogrammed.</p> <p><b>T-ONE Card</b></p> <p>When performing Immediate Start on E&amp;M trunks on a T-ONE card, the first inseize instruction must be Generate Inseize ACK.</p> |

| <b>Description</b>          | <p>Use the <i><b>SK_InterAppMsg</b></i> message to send arbitrary information from one application to another. An acknowledgment is sent to the application that originally sent <i><b>SK_InterAppMsg</b></i>.</p> <p><b>Important!</b> You must call setDataSize before calling setData. If not, data will not be copied into the data field.</p> <p>C developers must also copy the data manually. Otherwise, the data field will be truncated and the size set to 0 when the message is sent.</p> |
| <b>Sent by</b>              | Application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Argument Values**    The following table shows the arguments that you can modify in *InterAppMsg* :

| Argument                                 | Values and Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target<br>AppGroupTarget                 | Write the name of the application that is to receive the message into the Target field. If you do not specify Target, AppGroupTarget must contain the text name of the application group that is to receive this message. If both Target and AppGroupTarget are specified, Target is used.                                                                                                                                                                                                                                                                                                               |
| AckTimeout                               | Specifies the minimum time the LLC will wait for an acknowledgement to an InterAppMsg before it considers the InterAppMsg to have timed-out. This field only has meaning if the Type/UnAckedMsg field is set to SK_IAM_WITH_ACK. The actual time-out may be higher than the specified value because of the mechanism that LLC uses to keep track of outstanding requests. In any case, the time-out should occur within five seconds of the time-out value specified by the originator of the message. The default value for time-out, if not specified by the originator of the message, is 15 seconds. |
| Tag 1<br>Tag 2<br>Tag 3<br>Tag 4<br>Data | The Tag and Data fields are provided only for the convenience of the user. SwitchKit simply passes along these fields without any processing. You are responsible for assigning semantic meaning to these fields. The target application will receive a <i>SK_InterAppMsg</i> with all the fields filled in as they were filled in by the sending application.                                                                                                                                                                                                                                           |
| DataSize                                 | DataSize is used to specify how many bytes of data are in the Data array. The default amount of data that can be sent is 212 bytes. It can be increased up to 64KB. Refer to <i>Send Messages Larger than Default</i> .                                                                                                                                                                                                                                                                                                                                                                                  |

| Argument                 | Values and Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type<br>or<br>UnAckedMsg | <p>Specifies the expected behavior for this message.</p> <p>If the sender of the message fails to set this field before sending the message, the default will be SK_IAM_WITH_NO_ACK. In cases where acknowledgement is not expected, the recipient cannot send an acknowledgement using the InterAppMsgAck.</p> <p>There are three values allowed for this field:<br/> SK_IAM_WITH_ACK<br/> SK_IAM_BROADCAST<br/> SK_IAM_WITH_NO_ACK</p> <p><b>SK_IAM_WITH_ACK</b> - The sender of the InterAppMsg expects an acknowledgement from the recipient of the message. If the recipient fails to respond, LLC will generate an acknowledgement to the originator of the InterAppMsg with a status of SK_NO_ACK_FROM_SWITCH. If the recipient is not connected to the LLC, the LLC will generate an acknowledgement to the originator of the InterAppMsg with a status of SK_BAD_APP_NAME. In any case, the acknowledgement will come in the form of a message of type SK_InterAppMsgAck. See <i>Acknowledgment</i>.</p> <p><b>SK_IAM_BROADCAST</b> - The sender of the InterAppMsg would like to send this message to all members of the AppGroupTarget specified in the InterAppMsg. There is no acknowledgement expected for this message.</p> <p><b>SK_IAM_WITH_NO_ACK</b> - The sender of the InterAppMsg would like to send this message to its destination without expecting an acknowledgement.</p> <p>The fields, Type and UnAckedMsg, offer the same capability and therefore the field names are used interchangeably. Only one of the fields needs to be set.</p> |

### Send Messages Larger then Default

The following example shows how to send a message of 2000 bytes, if the structure *SK\_InterAppMsg* is used.

```
char storage[2000];
SK_InterAppMsg *msg = (SK_InterAppMsg *)storage;
msg->Data[0] = ...
msg->Tags = ...
char buf[2000];
int sz=2000;
int stat = sk_packMessage((MsgStruct *)msg,buf,&sz);
 if (stat != OK) {
 return stat;
 }
return sk_sendMessageWithHandler(buf,sz,tag,hf);
```

If the class *SKC\_InterAppMsg* is being used, the following example will send a message of 2000 bytes.

```
SKC_InterAppMsg msg(2000);
msg.setData...
msg.setTags...
char buf[2000];
int sz=2000;
int stat = sk_packMessage(msg.getStructPtr(),buf,&sz);
 if (stat != OK) {
 return stat;
 }
return sk_sendMessageWithHandler(buf,sz,tag,hf);
```

### Acknowledgment

To acknowledge *SK\_InterAppMsg*, the application must set the sequence number of the ACK to match the sequence number of the incoming message. For example:

```
int handleInterApp(SK_Event *evt, void *tag) {
 MsgStruct *msg = evt->IncomingMsg;
 SK_MSG_SWITCH(msg) {
 CASE_InterAppMsg(iam) {
 SK_InterAppMsgAck a;
 sk_initMsg(&a,TAG_InterAppMsgAck);
 sk_setSeqNum(&a,sk_getSeqNum(iam));
 a.Status = 0x10;
 sk_sendMsgStruct((MsgStruct *)&a, NULL, NULL);
 break;
 }
 }SK_END_SWITCH;
 return OK; //indicates that message was handled
}
```

If the C++ message classes are being used, the following example will send the ACK to an *SKC\_InterAppMsg*.

```
int handleInterApp(SK_Event *evt, void *tag) {
 SKC_Message *msg = evt->IncomingCMsg;
 SKC_MSG_SWITCH(msg) {
 CASEC_InterAppMsg(iam) {
 SKC_InterAppMsg ack;
 ack.setSeqNum(iam-getSeqNum())
 ack.setStatus(0x10);
 ack.setDataSize(0);
 ack.send();
 break;
 }
 }SKC_END_SWITCH;
 return OK; //indicates that message was handled
}
```

## IP Address Configure 0x00E7

---

**SwitchKit Name** IPAddressConfig

**Type** EXS API and SwitchKit API message

**Description** Use this message to configure the subnet mask and assign either a single IP address or all IP addresses at once. You do this by matching the number of TLVs to the number of IP addresses being assigned.

You can clear IP addresses by setting all of the IP address and subnet mask data to 0xFF. If you plan to take a card with IP addresses from one chassis and insert it into another chassis, be sure to clear all IP addresses on the card first. Otherwise, there might be a conflict with the IP addresses of the cards in the new chassis.

### NFS for DSP Series 2 card

To use TFTP or NFS, the DSP Series 2 card must be assigned an IP Address.

### Gateway Address

In order to assign a Gateway IP Address to a VDAC mother board or any of the four modules, you must include the Gateway IP TLV in the same message as the *IP Address Configure*. You can not assign a Gateway IP Address in a message where the Gateway IP Address is the only TLV in the message.

**Sent by** Host

**SwitchKit Code** Configuration

```
IPAddress Config (
 Node = integer,
 Slot = integer,
 DataType = integer,
 TLVCount = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 UBYTE Slot;
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_IPAddressConfig;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE TLVCount;
 UBYTE Data[250];
};
```

```
} XL_IPAddressConfigAck;
```

### C++ Class

```
class XLC_IPAddressConfig : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
 void setDataType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### C++ Class Response

```
class XLC_IPAddressConfigAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### EXS API Hex Format

| MESSAGE (White) |                                                                                                                                                 | RESPONSE (Gray) |                                                                                                                                                                   |

| <b>Description</b>    | <p>This message is used to inform the IP Signaling Series 3 card about a Matrix Controller. It sets up all of the information on the IP Signaling Series 3 card side that allows for the connection to the Matrix Controller.</p> <p>When an alarm.log file is created for this message, the logical node ID, 0xFE, is not shown in the log. Instead, this message shows an API logical node ID in the alarm.log.</p> |

## IP Signaling Series 3 Card Host Poll 0x0104

---

**Type** EXS API message

**Description** This message is sent unsolicited from the IP Signaling Series 3 card to the host on a periodic basis to allow the host to monitor the status of the IP Signaling Series 3 card. The default poll interval is one second.

**Sent by** CSP

### EXS Hex API Format

# IP Signaling Series 3 Card Query 0x0101

---

**SwitchKit Name**    IPCallServerQuery

**Type**    EXS API and SwitchKit API message

**Description**    This message is used by the host to query the details of the configuration data and the status of the IP Signaling Series 3 card interface.

**Message Type**    Configuration Query

**Sent By**    Host

## EXS Hex API Format

| <b>Description</b>    | This message is used for TCP/IP socket registration and operations. The message registers the TCP/IP socket, opens or closes a socket, and prohibits or allows traffic on a socket. |

**Sent by** Host

**SwitchKit Code**    **Configuration**

```
IPSocketConfig (
 Node = integer,
 Slot = integer,
 DataType = integer,
 TLVCount = integer,
 Data = string);
```

**C Structure**

```
typedef struct {
 BaseFields Base;
 UBYTE Slot;
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_IPSocketConfig;
```

**C++ Class**

```
class XL_IPSocketConfig : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
 void setDataType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

# ISDN Interface Configure 0x0060

---

**SwitchKit Name** ISDNInterfaceConfig

**Type** EXS API and SwitchKit API message

**Description** Use this message to configure general options to an ISDN interface. It should be sent immediately following the *D Channel Assign* message.

**NOTE:** PCM encoding for channels controlled by the D channel is defaulted based on the network signaling variant. E-1 spans configured for Euro-ISDN default to a-law, while all other variants default to  $\mu$ -law. For more information, see the message *PCM Encoding Format Configure* (0x00D9).

**Sent by** Host

**SwitchKit Code** **Configuration**

```
ISDNInterfaceConfig (
 Node = integer,
 Span = integer,
 Channel = integer,
 Entity = integer,
 Data = byte array);
```

## C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE Entity;
 UBYTE Data[222];
} XL_ISDNInterfaceConfig;
```

## C++ Class

```
class XLC_ISDNInterfaceConfig : public
 XLC_OutboundMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 int getMsgSize() const;
 void setMsgSize(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

| <b>Description</b>    | Use this message to query specific parameters configurable by the <i>ISDN Terminal Configure</i> , <i>ISDN Interface Configure</i> , and <i>PPL Configure</i> messages. Hosts applications should consider that future configuration options will be added to this query message, thus changing the length. |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                        |

 Data[16, 17] Protocol ID for component 13  
 Data[18, 19] Protocol ID for component 14

**0x04 IE Library**

Data[0] Entry Number (0–29)  
 Data[1] IE Type  
     0x01 Q.931 IEs  
 Include the following data fields only if Data[1] above is 0x01 (Q.931 IE type):  
 Data[2] Total IE Length (1–28)  
 Data[3. . .] IE Data

**0x05 HDLC Statistics**

Data[0, 1] Long Frames Detected  
 Data[2, 3] Aborts Received  
 Data[4, 5] CRC Errors  
 Data[6, 7] Short Frames  
 (Counters are reset after Query)

**0x06 USOP Database**

Eight blocks of information are reported for each USOP block configured on the D channel.  
 The format of each block is as follows:

Data[0-11] USPID  
 Data[12-21] Directory Number  
 Data[22] GSP Index  
 Data[23] Terminal Initialization Method  
     0x00 Auto FIT  
     0x01 Fixed NIT  
     0x02 Fixed FIT  
     0x80 Auto NIT with DN  
     0x81 Auto NIT with no Calling Party Number indicated  
         (use default USOP)  
 Data[24] Fixed TEI (0–63)

| <b>Type</b>           | EXS API and SwitchKit API message                                                                                                                    |
| <b>Description</b>    | This message is used by the host to configure the transmitted pattern of certain bits in different frames of a multi-frame over the J-ONE interface. |
| <b>Sent by</b>        | Host                                                                                                                                                 |

### SwitchKit Code Configuration

```
J1SpanConfig (
 Node = integer,
 StartSpanRange = integer,
 EndSpanRange = integer,
 ChanData = byte array,
 FrameData = byte array);
```

### C Structure

```
typedef struct {
 unsigned short StartSpanRange;
 unsigned short EndSpanRange;
 UBYTE ChanData[6];
 UBYTE FrameData[217];
} XL_J1SpanConfig;
```

### C++ Class

```
class XLC_J1SpanConfig : public XLC_SpanRangeMessage {
public:
 XBYTE getStartSpan() const;
 XBYTE getEndSpan() const;
 void setStartSpan(XBYTE s);
 void setEndSpan(XBYTE s);
 unsigned short getStartSpanRange() const;
 void setStartSpanRange(unsigned short x);
 unsigned short getEndSpanRange() const;
 void setEndSpanRange(unsigned short x);
 const UBYTE *getChanData() const;
 UBYTE *getChanData();
 void setChanData(UBYTE *x);
 const UBYTE *getFrameData() const ;
 UBYTE *getFrameData();
 void setFrameData(UBYTE *x);
};
```

|                    |                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                                                                                       |
| <b>Purpose</b>     | Use LLCControl to manage the behavior of LLC. LLCControl can be used to dynamically modify environment variables and to manage SS7 redundancy.                              |
| <b>Description</b> | The message is used for controlling or modifying the behavior of the LLC. The message consists of a sequence of TLVs, a command TLV followed by one or more parameter TLVs. |

## Establish Redundancy

The *SK\_LLC\_CONTROL\_ESTABLISH\_REDUNDANCY\_TLV* is used to initiate synchronization between components that are configured as redundant pairs. Synchronization can only be initiated if the components have been previously configured as redundant pairs and each component is in a state where synchronization can commence. A successful reply to this message indicates that the synchronization process has been initiated. It does not indicate the success or failure of that synchronization process.

The use of this TLV requires that the ComponentType and PrimaryLNI TLV's also be included and properly defined. The only component type supported is SS7 (0x1000).

## Control Switchover

*SK\_LLC\_CONTROL\_SWITCHOVER\_COMP\_TLV* (0x0021) is used to initiate a switchover of fully synchronized, redundant components. Switchover can only be initiated if the components have been previously configured as redundant pairs and each component is in a state where switchover can occur. A successful reply to this message indicates that the switchover process has been initiated. It does not indicate the success or failure of that switchover process.

The use of this TLV requires that the Component Type and Primary LNI TLV's also be included and properly defined. The only component type supported is SS7(0x1000).

**Sent by** Application

**How to use** To use *LLCControl*, construct the message and set the TLV information.

```
SKC_LLCCControl1q;
1q.setDataSize(DataSize);
1q.setTLVCount(TLVCount);
1q.setData(data);
```

**Arguments** The following table shows the arguments you can change:

| Argument | Description                  |
|----------|------------------------------|
| DataSize | Number of bytes of the data. |
| TLVCount | Number of TLVs in the data.  |
| data     | Data bytes.                  |

#### Status Argument

The following are values that can be returned in the Status argument of *LLCControlAck*

| Value                            | Description                                                                |
|----------------------------------|----------------------------------------------------------------------------|
| SK_BAD_PARAM                     | Returned if there is an unknown command TLV.                               |
| SK_BAD_OR_MISSING_PARAM          | A required parameter TLV is missing from the LLCControl.                   |
| SK_NODE_NOT_PREVIOUSLY_DEFINED   | A node specified in a parameter TLV is unknown to the LLC.                 |
| SK_UNABLE_TO_INITIATE_SYNC       | An attempt to initiate synchronization of SS7 redundant components failed. |
| SK_UNABLE_TO_INITIATE_SWITCHOVER | An attempt to initiate switchover of SS7 redundant components failed.      |
| SK_UNKNOWN_REDUNDANT_COMPONENT   | The specified redundant component is unknown.                              |

**Command TLVs      SK\_LLC\_CONTROL\_ESTABLISH\_REDUNDANCY (0x0015)**

| Byte   | Description                                                  |
|--------|--------------------------------------------------------------|
| Tag    | Data[0, 1] =<br>SK_LLC_CONTROL_ESTABLISH_REDUNDANCY (0x1015) |
| Length | Data[2,3] = 0x0000                                           |

**SK\_LLC\_CONTROL\_SWITCHOVER\_COMP\_TLV (0x0021)**

| Byte   | Description                                                 |
|--------|-------------------------------------------------------------|
| Tag    | Data[0, 1] =<br>SK_LLC_CONTROL_SWITCHOVER_COMP_TLV (0x0021) |
| Length | Data[2, 3] = 0x0000                                         |

**Parameter TLVs      SK\_LLC\_CONTROL\_GO\_STANDBY\_TLV (0x0016)**

This SK\_LLC\_CONTROL\_GO\_STANDBY\_TLV will cause an LLC switchover. The current Active LLC will become Standby and will inform the current Standby (if any) that it should become Active. Note that switchover behavior is dependant on the current SK\_LLC\_SWITCHBACK\_MODE environment variable. See the environment variables section for details.

| Byte   | Description                                            |
|--------|--------------------------------------------------------|
| Tag    | Data[0, 1] =<br>SK_LLC_CONTROL_GO_STANDBY_TLV (0x0016) |
| Length | Data[2, 3] = 0x0000                                    |
| Value  | Not Applicable                                         |

**SK\_COMPONENT\_TYPE\_TLV (0x1008)**

| Byte   | Description                                 |
|--------|---------------------------------------------|
| Tag    | Data[0, 1] = SK_COMPONENT_TYPE_TLV (0x1008) |
| Length | Data[2, 3] = 0x0002                         |

| Byte  | Description                                                       |
|-------|-------------------------------------------------------------------|
| Value | Data[4, 5] = Component ID (currently only support 0x1000 for SS7) |

**SK\_PRIMARY\_LNI\_TLV (0x1006)**

| Byte   | Description                                                       |
|--------|-------------------------------------------------------------------|
| Tag    | Data[0, 1] = SK_PRIMARY_LNI_TLV (0x1006)                          |
| Length | Data[2, 3] = 0x0002                                               |
| Value  | Data[4, 5] = Component ID (currently only support 0x1000 for SS7) |

**C Structure**

```
typedef struct {
 unsigned short DataSize;
 UBYTE TLVCount;
 UBYTE Data[250];
} SK_LLCControl;
```

**C Structure Response**

```
typedef struct {
 int Status;
 UBYTE reserved21[10]
} SK_LLCControlAck;
```

**C++ Class**

```
class SKC_LLCControl : public SKC_ToolkitMessage {
public:
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getTLVData();
 void setTLVData(UBYTE *x);
};
```

**C++ Class Response**

```
class SKC_LLCControlAck : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
```

## LLCQuery

---

|                    |                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                                                                                                                                                                                                           |
| <b>Purpose</b>     | Use the <b>LLCQuery</b> message to query the LLC for information. Currently, only information about configured nodes is available.                                                                                                                                                              |
| <b>Description</b> | <p>The message is for querying the LLC for node related information. Supported queries include the following:</p> <ul style="list-style-type: none"><li>• Logical Node IDs</li><li>• IP address of the active matrix controller</li><li>• IP address of the standby matrix controller</li></ul> |
| <b>Sent by</b>     | Application                                                                                                                                                                                                                                                                                     |
| <b>How to use</b>  | <p>To use <b>LLCQuery</b>, construct the message and set the TLV information.</p> <pre>SKC_LLCQuery lq;<br/>lq.setDataSize(DataSize);<br/>lq.setTLVCount(TLVCount);<br/>lq.setData(data);</pre>                                                                                                 |
| <b>Arguments</b>   | <p>The following table shows the arguments you can change in LLCQuery:</p>                                                                                                                                                                                                                      |

| Argument | Description                  |
|----------|------------------------------|
| DataSize | Number of bytes of the data. |
| TLVCount | Number of TLVs in the data.  |
| data     | Data bytes.                  |

### Status

These values can be returned in the Status argument of **SK\_LLCQueryAck**.

- SK\_BAD\_PARAM if unknown, query TLV.
- SK\_INVALID\_NODE if unknown node ID is given.

**TLVs** You can use several TLVs with **LLCQuery**. See TLV Syntax:

### Queries

- PopulationQueryTLV (0x0002)

- NodeInfoQueryTLV (0x0003)
- LLC\_REDUNDANCY\_QUERY\_TLV (0x0005)

### Responses

- NodeInfoTLV (0x8010)
- RequestedMatrixInfoTLV (0x8011)
- RequestedDeviceServerTLV (0x8012)
- RequestedKnownNodeInfoTLV (0x8013)
- *GenericLLCReport* messages

### PopulationQuery TLV

The PopulationQuery TLV is used to query the LLC about any nodes it has detected. This TLV can request information on controlled nodes, known nodes, or both controlled and known nodes. A controlled node is any node directly under this LLC's control, while a known node is under another LLC's control.

The valid values for this option are:

ControlledNode (0x01)

KnownNode (0x02)

ControlledAndKnownNode (0x03)

The LLC will respond with an LLCQueryAck with zero or more NodeInfo TLVs; one for each node that matches the criteria: known or controlled. These TLVs reveal the Logical Node ID, the Node Type, and whether the link is up, down, or unknown. If the node is not controlled by this LLC, then the link status will not be known.

If no nodes match the criteria, then an LLCQueryAck will be returned with as a positive ACK with no TLVs.

### NodeInfoQuery TLV

The NodeInfoQuery TLV is used to query the LLC about a specific node ID. It has one TLV field: Logical Node ID.

The LLC responds to NodeInfoQuery TLVs with an LLCQueryAck with various TLVs depending on what type of device the node is. These TLVs would be one of the following:

- RequestedMatrixInfoTLV
- RequestedDeviceServer LV

- RequestedKnownNodeInfoTLV

The above TLVs contain all the information the LLC knows about the node. For example, if the device is a standard CSP with two Matrix cards, then the ACK will contain two RequestedMatrixInfo TLVs; one for each card. However, if the node type is a device server, for example, the IP Signaling Series 3 card, the ACK will contain one RequestedDeviceServerTLV. If the node is merely a “known node”, then the RequestedKnownNodeInfoTLV will be returned regardless of what type of node it is.

### SK\_LLC\_REDUNDANCY\_QUERY\_TLV (0x0005)

The SK\_LLC\_REDUNDANCY\_QUERY\_TLV is used to query the redundancy status of the primary and redundant LLCs. The LLC will respond with a *GenericLLCReport* message of type SK\_LLC\_REDUNDANCY for each LLC. See the *GenericLLCReport* section for details on message behavior and format.

| Description | Byte (Value)                                         |
|-------------|------------------------------------------------------|
| Tag         | Data[0, 1] = 0x0005<br>(SK_LLC_REDUNDANCY_QUERY_TLV) |
| Length      | Data[2, 3] = 0x0000                                  |
| Value       | There are no values for this option.                 |

**C Structure**

```
typedef struct {
 unsigned short DataSize;
 UBYTE TLVCount;
 UBYTE Data[250];
} SK_LLCQuery;
```

**C Structure Response**

```
typedef struct {
 unsigned short DataSize;
 int Status;
 UBYTE TLVCount;
 UBYTE Data[246];
} SK_LLCQueryAck;
```

**C++ Class**

```
class SKC_LLCQuery : public SKC_ToolkitMessage {
public:
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
```

```
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x);
};
```

**C++ Class Response**

```
class SKC_LLCQueryAck : public SKC_ToolkitAck {
public:
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 int getStatus() const;
 void setStatus(int x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**TLV Syntax**

Below is the definition of all TLVs used in the LLC Query message and the LLC Query Acknowledgement (ACK) message.

**PopulationQueryTypeTLV (0x0002)**

| Description | Byte (Value)                                 |
|-------------|----------------------------------------------|
| Tag         | Data[0, 1] = 0x0002 (PopulationQueryTypeTLV) |
| Length      | Data[2, 3] = 0x0001 (LLCPopulationQuery)     |
| Value       | Data[4] = Known Controlled/Both              |

**NodeInfoQueryTLV (0x0003)**

| Description | Byte (Value)                           |
|-------------|----------------------------------------|
| Tag         | Data[0, 1] = 0x0003 (NODEINFOQueryTLV) |
| Length      | Data[2, 3] = 0x0002                    |
| Value       | Data[4, 5] = Logical Node ID           |

**NodeInfoTLV (0x8010)**

| Description | Byte (Value)                      |
|-------------|-----------------------------------|
| Tag         | Data[0, 1] = 0x8001 (NodeInfoTLV) |
| Length      | Data[2, 3] = 0x0003               |

| Description | Byte (Value)                                                                        |
|-------------|-------------------------------------------------------------------------------------|
| Value       | Data[4, 5] = Logical Node ID<br>Data[6] = Node Type<br>Data[7] = SK_LINK_UP/DOWN/NA |

**RequestedMatrixInfoTLV (0x8011)**

| Description | Byte (Value)                                                                                                                                                                                                         |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x8011 (RequestedMatrixInfoTLV)                                                                                                                                                                         |
| Length      | Data[2, 3] = 0x000D                                                                                                                                                                                                  |
| Value       | Data[4, 5] = Logical Node ID<br>Data[6, 9] = Matrix IP<br>Data[10] = SystemType<br>Data[11] = MatrixSide<br>Data[12] = MatrixState<br>Data[13] = AdjMatrixState<br>Data[14] = StatusBits<br>Data[15, 16] = ExcelPort |

**RequestedDeviceServerInfoTLV (0x8012)**

| Description | Byte (Value)                                                                                                                                                                                                                                                                  |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x8012<br>(RequestedDeviceServerInfoTLV)                                                                                                                                                                                                                         |
| Length      | Data[2, 3] = 0x000D                                                                                                                                                                                                                                                           |
| Value       | Data[4, 5] = Logical Node ID<br>Data[6, 9] = Matrix IP<br>Data[10, 11] = IP Signaling Series 3 status<br>Data[12] = SystemType<br>Data[13] = IP Signaling Series 3 Card Type<br>Data[14] = State<br>Data[15] = Adjacent State<br>Data[16] = StatusBits<br>Data[17] = Reserved |

**RequestedKnownNodeInfoTLV (0x8013)**

| <b>Description</b> | <b>Byte (Value)</b>                                     |
|--------------------|---------------------------------------------------------|
| Tag                | Data[0, 1] = 0x8013<br>(RequestedKnownNodeInfoTLV)      |
| Length             | Data[2, 3] = 0x0000                                     |
| Value              | Data[4, 5] = Logical Node ID<br>Data[6, 9] = IP Address |

| <b>Description</b>    | This message allows you to enable or disable loopback diagnostics on the E-ONE, DS3, and T-ONE line cards. Also, this message will query the loopback mode configured on the card.<br><br><b>Example:</b> The span must be out of service before you send it this message. |
| <b>Sent By</b>        | Host                                                                                                                                                                                                                                                                       |

## SwitchKit Code Configuration

```
LoopBackConfig (
 Node = integer,
 Span = integer,
 LoopbackType = integer);
```

### C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE LoopbackType;
} XL_LoopBackConfig;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE LoopbackType;
 UBYTE LoopbackStatus;
} XL_LoopBackConfigAck;
```

### C++ Class

```
class XLC_LoopBackConfig : public XLC_SpanMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getLoopbackType() const;
 void setLoopbackType(UBYTE x);
};
```

### C++ Class Response

```
class XLC_LoopBackConfigAck : public
 XLC_AcknowledgeMessage {
public:
```

```

 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getLoopbackType() const;
 void setLoopbackType(UBYTE x);
 UBYTE getLoopbackStatus() const;
 void setLoopbackStatus(UBYTE x);
 };

```

## Loop Timing Configure 0x004A

---

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <b>SwitchKit Name</b> | LoopTimingConfig                                 |
| <b>Type</b>           | EXS API and SwitchKit API message                |
| <b>Description</b>    | This message sets or clears loop timing sources. |

**NOTE:** This message not supported on the DS3 card because it is not intended to be a loop timing source.

**Sent by** Host

**Example Message (Socket Log Output in SwitchKit)** In the following socket log output/example message, the host clears loop timing on Slot 01, Physical Span 01:

00 0D 00 4A 00 00 FF 00 01 13 02 01 01 01 02

### SwitchKit Code Configuration

```
LoopTimingConfig
Node = integer,
Slot = integer,
Offset = integer,
Type = integer,
Action = integer);
```

### C Structure

```
typedef struct {
 UBYTE Slot;
 UBYTE Offset;
 UBYTE Type;
 UBYTE Action;
} XL_LoopTimingConfig;
```

### C++ Class

```
class XLC_LoopTimingConfig : public XLC_SlotMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getOffset() const;
 void setOffset(UBYTE x);
 UBYTE getType() const;
 void setType(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
};
```

## EXS API Hex Format

## Matrix Status Report 0x00E5

---

**SwitchKit Name** DeviceServerStatusReport

**Type** EXS API and SwitchKit API message

**Description** This is an unsolicited message sent from the Matrix Controller to the Host in different situations. This is generally caused by an IP Signaling Series 3 card interaction about which the Host requires information.

**NOTE:** This message supports a feature of a Cantata product other than SwitchKit. For this reason, the message is **not to be used in a SwitchKit only environment**.

**Sent by** CSP

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short DeviceServer;
 UBYTE TLVCount;
 UBYTE Data[222];
} XL_DeviceServerStatusReport;
```

### **C++ Class**

```
class XLC_DeviceServerStatusReport : public
 XLC_InboundMessage {
public:
 unsigned short getDeviceServer() const;
 void setDeviceServer(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

## MessageWrapper

---

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>                      | SwitchKit API message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Purpose</b>                   | Use <i>SK_MessageWrapper</i> to provide the means to tunnel through the LLC. That is, the message to be tunneled is encapsulated inside the MessageWrapper. When the LLC receives a MessageWrapper, it extracts the payload message and delivers the extracted bytes to the proper node.                                                                                                                                                                                                                                                                                                             |
| <b>Payload</b>                   | <p>The payload is a message in CSP format which includes everything from the length up to, but not including, the checksum. Here is a Card Population Query as it would formatted as C-style code:</p> <pre>UBYTE CardPop[] = {00, 05, 00, 07, 00, 02, 01};</pre> <p>That is: length (00, 05), Message Type (00, 07), Reserved (00), Sequence Number (02), and LNI(01).</p> <p>The only change LLC will make is to change the Sequence Number to a suitable value following the same rules as any other message. (In-use Sequence Numbers must be unique per message type per device.)</p>           |
| <b>Tunneling through the LLC</b> | <p>Message Tunneling is a means of sending a message through the LLC to a device, without LLC attempting to process the message. A message enters the LLC and is delivered directly to the target node. When and if an acknowledgement is received, the LLC delivers to the originating application. Since LLC will not have to examine MessageWrappers for any special processing, the delivery time improves. Occasionally, a new message type is added to the CSP. Since the LLC does limited processing of tunneled messages, it doesn't need to understand the message in order to send it.</p> |
| <b>Sent by</b>                   | Applications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Arguments** The following table shows the arguments you can change:

| Parameter      | Description                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| WaitForAck:    | Set this field to a non-zero value if an acknowledgement is expected for this message. Otherwise, set it to zero.    |
| PayloadTimeout | If WaitForAck is non-zero, then LLC will wait at least PayloadTimeout seconds for an acknowledgment.                 |
| TargetNodeId   | The Logical Node ID of the device using this message.                                                                |
| PayloadSize    | The payload size in bytes.                                                                                           |
| Payload        | A properly formatted CSP format message including everything from the length up to, but not including, the checksum. |

### Status Argument

The following are values that can be returned in the Status argument of *MessageWrapperAck*:

| Value                 | Description                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TargetNodeId          | The Logical Node ID of the device using this message.                                                                                                                                                                                                                                                                                                                                      |
| PayloadSize           | The payload size in bytes. If this is a NACK, then PayloadSize is zero.                                                                                                                                                                                                                                                                                                                    |
| Payload               | The response from the CSP to the tunneled message.                                                                                                                                                                                                                                                                                                                                         |
| 0x10                  | <p>If WaitForAck was non-zero, then this response value means that an ack was received within the specified timeout period. If WaitForAck was zero (do not wait) then 0x10 means the message was delivered to the device.</p> <p>A positive response does not imply that the tunneled message was successful, only that it was delivered successfully. The payload may contain a NACK.</p> |
| SK_INVALID_NODE       | TargetNodeId does not exist or is not LINK_UP                                                                                                                                                                                                                                                                                                                                              |
| SK_NO_ACK_FROM_SWITCH | Timeout occurred while LLC was waiting for an acknowledgment to the tunneled message.                                                                                                                                                                                                                                                                                                      |

**C Structure** typedef struct {

```

BaseFields Base;
unsigned short TargetNodeId;
UBYTE WaitForAck;
UBYTE PayloadTimeout;
unsigned short PayloadSize;
UBYTE Payload[247];
} XL_MessageWrapper;

```

## C Structure Response

```

C-Structure
typedef struct {
 BaseFields Base;
 unsigned short Status;
 UBYTE reserved6[13];
 unsigned short TargetNodeId;
 unsigned short PayloadSize;
 UBYTE Payload[247];
} XL_MessageWrapperAck;

```

## C++ Class

```

class XLC_MessageWrapper: public XLC_OutboundMessage {
 unsigned short getTargetNodeId() const;
 void setTargetNodeId(unsigned short x);
 UBYTE getWaitForAck() const;
 void setWaitForAck(UBYTE x);
 UBYTE getPayloadTimeout() const;
 void setPayloadTimeout(UBYTE x);
 unsigned short getPayloadSize() const;
 void setPayloadSize(unsigned short x);
 const UBYTE *getPayload() const;
 UBYTE *getPayload();
 void setPayload(UBYTE *x);
};

```

## C++ Class Response

```

class XLC_MessageWrapperAck: public
 XLC_AcknowledgeMessage {
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getTargetNodeId() const;
 void setTargetNodeId(unsigned short x);
 unsigned short getPayloadSize() const;
 void setPayloadSize(unsigned short x);
 const UBYTE *getPayload() const;
 UBYTE *getPayload();
 void setPayload(UBYTE *x);
};

```

- Limitations** There is no way to tunnel to an application an unsolicited CSP message. The application must continue to register to receive these.
- socket.log** In the socket.log, messages that have been tunneled will be displayed with an asterisk preceding the bytes.

**Example of an outbound message:**

```
Apr 01 2002 13:44:22 H->X2[10.10.158.16] * : 01 01 00 00
fe 00 02 52 02 00 02 53 04 00 20 00 01 02
```

**Example of an inbound message:**

```
Apr 01 2002 13:44:22 X2[10.10.158.16]->H * : 01 01 00 00
fe 00 10 00 02 52 02 00 02 53 04 00 20 00 01 07 00 05
00 02 00 03 00 08 00 02 01 01 00 07 00 02 00 01 00 0a
00 04 00 05 00 05 00 0c 00 06 0a 0a 9e 07 31 51 00 0d
00 06 00 00 00 00 00 00 00 0e 00 02 00 01
```

**LLC message validation**

The LLC will make no attempt to validate the contents of the payload. Since the CSP will not NACK ill formed messages (it generates an alarm instead) the likely response will be SK\_NO\_ACK\_FROM\_SWITCH.

**Example Code** This code example sends an IP Signaling Series 3 Card Query message (0x101) to a device server with a node id of 0x02:

```
UBYTE sqbuf[] = {
 0x00, 0x13, //length
 0x01, 0x01, // tag
 0x00, //reserved
 0x00, // seq num
 0xfe, // ELNI
 0x00, // address method
 0x02, // num address elements
 0x52, 0x02, 0x00, 0x02, // ELNI
 0x53, 0x04, 0x00, 0x20, 0x00, 0x01, // ObInstId
 0x02, // query type
 0x00 //reserved
};
```

```
XLC_MessageWrapper sq(sizeof(sqbuf)+0x20);
```

```
sq.setPayloadSize(sizeof(sqbuf));
memcpy(sq.getPayload(), sqbuf, sizeof(sqbuf));
sq.setTargetNodeId(0x02);
sq.setWaitForAck(1);
sq.setPayloadTimeout(0x10);
sq.send();
```

This code example is from the handler function for this message:

```
CASEC_MessageWrapperAck(mwa)
{
 cout << "ACK: " << hex << mwa->getStatus() << endl;
 cout << " Payload size: " << mwa->getPayloadSize() << endl;
 cout << " Payload: ";

 if (mwa->getStatus() == 0x10)
 {
 for (int x = 0; x<mwa->getPayloadSize(); x++)
 {
 cout << hex << (int)mwa->getPayload()[x] << " ";
 }
 cout << endl;
 }
 return OK;
}
```

## MonitorChannel

---

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                           |

| <b>Description</b>    | <p>Use this message to register a host to receive or not receive specific API messages, as well as the PPL components for which <i>PPL Event Indication</i> messages are sent by the CSP. You also use this message to query the registration status for a specific host.</p> <p>Note the following:</p> <ul style="list-style-type: none"> <li>You can only send one ICB subtype per message.</li> <li>Multi-Host Control is disabled by default. You enable it with Action ICB Subtype 0x33.</li> </ul> <p><b>Definitions</b></p> <p>Hard Register - CSP-initiated messages or <i>PPL Event Indications</i> messages will be received by the host regardless if any other hosts are receiving it.</p> <p>Soft Register - CSP-initiated messages or <i>PPL Event Indications</i> messages will be received by the host only if the messages are not destined for any other host, either by none registering for them or by the registered host(s) not having socket connectivity.</p> <p>De-register - CSP-initiated messages or <i>PPL Event Indications</i> messages will not be received by the host under any circumstances.</p> <p>PPL-Component IDs - PPL-component IDs are a sub-field in the <i>PPL Event Indication</i> message. Registration for these IDs will cause the <i>PPL Event Indication</i> message with this ID as a sub-field to be sent to the registered host. To receive all <i>PPL Event Indication</i> messages, a host should register for the <i>PPL Event Indication</i> message itself, and not use the PPL-component ID registration.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**C Structure Response**

```
typedef struct {
 tus;
 UBYTE Data[251];
} XL_MultiHostConfigAck;
```

**C++ Class**

```
class XLC_MultiHostConfig : public XLC_OutboundMessage {
public:
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**C++ Class Response**

```
class XLC_MultiHostConfigAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message**

The following table provides an overview of this message. The table following it, provides the detail for each byte.

| MESSAGE (White) |                       | RESPONSE (Gray) |                       |

|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SwitchKit Name</b>       | NGAStateQuery                                                                                                                                                                                                                                                                                                        |
| <b>Type</b>                 | EXS and SwitchKit API message                                                                                                                                                                                                                                                                                        |
| <b>Description</b>          | Queries the M3UA objects for their actual state status. Do not confuse with the Service State Query. The following example shows the difference. If the user puts a link in service but the link is not physically connected, the service state is <i>In Service</i> but the state status is <i>Out of Service</i> . |
| <b>Sent by</b>              | Host application                                                                                                                                                                                                                                                                                                     |

## Node Status Query 0x006F

---

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>SwitchKit Name</b> | NodeStatusQuery                                                                                                    |
| <b>Type</b>           | EXS API and SwitchKit API message                                                                                  |
| <b>Description</b>    | Use this message to query the status of a CSP node in a multi-node system. The status is reported in the response. |
| <b>Sent by</b>        | Host                                                                                                               |

### SwitchKit Code C Structure

```
typedef struct {
 } XL_NodeStatusQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 int PhysicalNode;
 UBYTE LogicalNode;
 UBYTE HostNode;
 UBYTE NodeStatus;
 } XL_NodeStatusQueryAck;
```

### C++ Class

```
class XLC_NodeStatusQuery : public XLC_OutboundMessage {
public:
 };
```

### C++ Class Response

```
class XLC_NodeStatusQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 int getPhysicalNode() const;
 void setPhysicalNode(int x);
 UBYTE getLogicalNode() const;
 void setLogicalNode(UBYTE x);
 UBYTE getHostNode() const;
 void setHostNode(UBYTE x);
 UBYTE getNodeStatus() const;
 void setNodeStatus(UBYTE x);
 };
```

| <b>Description</b>    | <p>This message instructs the CSP to outputpulse up to two strings of digits to the specified channel. The strings may be in BCD or non-BCD format.</p> <p>Using non-BCD format allows the host to insert silence between the outputpulsing of digits by inserting delay digits (0x10) within the digit string. When a delay digit is encountered in a digit string, the DSP providing the outputpulsing will transmit silence for the delay duration. The delay duration is configured by the host in this message. Delay digits may be grouped to provide dynamic delay durations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>      | <p>Use this message to control outgoing call setup during real-time call processing on the specified channel. Instructions and data are passed in the form of Information Control Blocks (ICBs).</p> <p>You can preprogram a list of instructions using the <i>Outseize Instruction List Configure</i> message and initiate them by sending the <i>Outseize Control</i> message with an ICB of "Use Instruction List." Note the seize instruction cannot be pre-programmed.</p> <p>An instruction that is not carried out reports a negative Acknowledgment. A positive acknowledgment is reported only if an Action ICB of "Send Host Acknowledgment" is included in the message.</p> <p>Contact Cantata Technical Support if you want to send an <i>Outseize Control</i> message greater than 512 bytes.</p> <p><b>ISDN PRI and SS7</b></p> <p>Outseize instructions cannot be preprogrammed for ISDN PRI or SS7 channels. You must include all outseize instructions for ISDN PRI and SS7 in the <i>Outseize Control</i> message.</p> <p>For an SS7 channel, this message results in an IAM being sent to the network. Mandatory parameters must be included in an SS7 Parameters ICB.</p> |

### C++ Class

```
class XLC_OutseizeControl : public XLC_OneChannelOutbound
{
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getICBCount() const;
 void setICBCount(UBYTE x);
 const UBYTE *getICBData() const;
 UBYTE *getICBData();
 void setICBData(UBYTE *x);
};
```

### C++ Class Response

```
class XLC_OutseizeControlAck : public
XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

| : | <p>ICB</p> <p>NOTE: For an SS7 channel in ANSI ISUP CRM/CRA, the <i>Outseize Control</i> message must include an SS7 Parameters ICB. This allows a CRM message type to be part of the SS7 Parameter ICB that is sent in the <i>Outseize Control</i> message. To send an IAM message after an <i>Outseize Control</i> message with CRM, a separate <i>PPL Event Request</i> for IAM must be made.</p> <p>0x01 Action</p> <ul style="list-style-type: none"> <li>0x00 Null*</li> <li>0x01 Scan For Wink N</li> <li>0x02 Scan For ANI Request Off-hook*</li> <li>0x03 Scan For Dial Tone*</li> <li>0x04 Report Call Processing Event</li> <li>0x05 Outpulse Stage N Address Data</li> <li>0x06 Wait For Host Address Data*</li> <li>0x07 Wait For Host Control*</li> <li>0x08 Send Host Acknowledgment *</li> <li>(the ISDN PRI card ignores the Send Host Acknowledgment)</li> <li>0x09 Do Call Progress Analysis (T-ONE calls only)</li> <li>0x0A Seize (see Note 3)*</li> <li>0x0B Use Instruction List</li> <li>0x0C Reserved*</li> <li>0x0D Cancel R2 Receiver*</li> <li>0x0E Scan For Backward R2 Signal*</li> <li>0x0F Wait For Host Control With Answer Supervision (see Note 4)*</li> <li>0x10 Do Call Progress Analysis Without Line Signaling</li> <li>0x11 Delay N Milliseconds</li> </ul> <p>0x02 Data</p> <ul style="list-style-type: none"> <li>0x01 Stage N Address Data</li> <li>0x02 Stage N Address Data</li> <li>0x10 ISDN Formatted IEs</li> <li>0x11 ISDN Raw IEs</li> <li>0x12 SS7 Parameters</li> <li>0x15 DASS2/DPNSS Raw Data</li> <li>0x1C SS7 TUP Formatted Fields</li> <li>0x1E Generic PPL</li> <li>0x25 ISDN Segmented Message</li> <li>0x66 SS7 Address Information</li> </ul> <p>0x03 Extended Data</p> <ul style="list-style-type: none"> <li>0x0012 SS7 Formatted Parameters</li> <li>0x0033 NPDI Universal ICB</li> <li>0x001E Generic PPL</li> </ul> <p>* The ICB has no data, so you will always use 0x00 for the value of the Data Length field.</p> |

**Notes:**

1. When the system outpulses BCD-encoded digits, a Stage N Address Data ICB must accompany the digits to define the outpulsing parameters. The position of the Data ICB is not critical.
2. The host must have a DSP configured for Call Progress Analysis for a “Do Call Progress Analysis” ICB to be invoked. For more information, refer to the message *DSP SIMM Configure* (0xC0)
3. A seize instruction, when present, must be the first Action ICB. A seize instruction cannot be included in a preprogrammed outseize instruction list.
4. If Answer Supervision Mode is configured for “Notify” or “Notify and Propagate,” the host will be informed with a Call Processing Event message of “Answer.” Note that the default Answer Supervision Mode is “Propagate.”

# Outseize Instruction List Configure 0x002A

| <b>Description</b>                                           | <p>Use several of these messages to preprogram a list of instructions for outseize control on CAS channels. You must send a separate <i>Outseize Instruction List Configure</i> message for each instruction that you add to the list.</p> <p>Outseize instructions cannot be preprogrammed for ISDN PRI or SS7 channels. You must include all outseize instructions for ISDN PRI and SS7 in the <i>Outseize Control</i> message.</p> <p>After configuring a channel with an Outseize Instruction List, the CSP uses the list to initiate an outseizure on a channel. You set this up by sending an <i>Outseize Control</i> message with a “Use Instruction List” ICB.</p> <p>The last instruction in a list should always be “Wait For Host Control” or “Wait for Host Control with Answer Supervision,” where the CSP waits for further instructions from the host to continue processing.</p> <p><b>NOTE:</b> A seize instruction <i>cannot</i> be preprogrammed.</p> |

## SwitchKit Code Configuration

```
OutseizeInstrListConfig (
 Node = integer,
 Range = StartSpan:StartChan - EndSpan:EndChan,
 InstrNum = integer,
 InstrType = integer,
 InstrData1 = integer,
 InstrData2 = integer);
```

## C Structure

```
typedef struct {
 unsigned short StartSpan;
 UBYTE StartChannel;
 unsigned short EndSpan;
 UBYTE EndChannel;
 UBYTE InstrNum;
 UBYTE InstrType;
 UBYTE InstrData1;
 UBYTE InstrData2;
} XL_OutseizeInstrListConfig;
```

## C++ Class

```
class XLC_OutseizeInstrListConfig : public
 XLC_ChangeRangeMessage {
public:
 unsigned short getStartSpan() const;
 void setStartSpan(unsigned short x);
 UBYTE getStartChannel() const;
 void setStartChannel(UBYTE x);
 unsigned short getEndSpan() const;
 void setEndSpan(unsigned short x);
 UBYTE getEndChannel() const;
 void setEndChannel(UBYTE x);
 UBYTE getInstrNum() const;
 void setInstrNum(UBYTE x);
 UBYTE getInstrType() const;
 void setInstrType(UBYTE x);
 UBYTE getInstrData1() const;
 void setInstrData1(UBYTE x);
 UBYTE getInstrData2() const;
 void setInstrData2(UBYTE x);
};

| :               | Instruction Number                                                                                                                                                                                                                                                                                  |                 |                       |
|                 | You must assign each message an instruction number. The <i>Outseize Control</i> message specifies the first instruction in the list to be used and the CSP executes each message in order, by instruction number until the wait for host control instruction. Valid instruction numbers are 1 - 20. |                 |                       |
|                 | To clear all instructions from a channel, set the <i>Instruction Number</i> to 0xFF and <i>Instruction Type</i> to 0x00 (Null).                                                                                                                                                                     |                 |                       |

**Default Outseize  
Instruction Lists**

The default instructions for T1 and E1 protocols are as follows:

**T1**

1. Wait For Host Control Message

**E1**

1. Outputse Stage 1 Digits
2. Outputse Stage 2 Digits
3. Outputse Stage 3 Digits
4. Outputse Stage 4 Digits
5. Report Call Processing Event
6. Wait For Host Control Message

## PCM Encoding Format Configure 0x00D9

| <b>Description</b>    | <p>This message allows the host to set the PCM encoding format of a channel to A-law or <math>\mu</math>-law on T1 or E1 spans.</p> <p>If an A-law encoded channel is connected to a <math>\mu</math>-law encoded channel, the CSP performs the necessary conversion between the two channels to allow the appropriate voice data to be transmitted to both listeners.</p> <p>Channels on E1 line cards default to A-law encoded format.</p> <p>When you configure SS7 with an ANSI stack over an E1 Card, you must send the PCM Encoding Format Configure message with the PCM encoding format set to A-law <b>after</b> you send the SS7 Signaling Stack Configure (0x5C) message. The SS7 Signaling Stack Configure message overwrites the PCM Encoding Format Configure message.</p> <p>Channels on T1 line cards default to <math>\mu</math>-law encoded format.</p> <p>When you configure SS7 with an ITU stack over a T1 Card or you configure Euro-ISDN over T-1, you must send the PCM Encoding Format Configure message with the PCM encoding format set to <math>\mu</math>-law <b>after</b> you send the SS7 Signaling Stack Configure or the ISDN Interface Configure (0x60) messages. The ISDN Interface Configure message overwrites the PCM Encoding Format Configure message.</p> <p>Occasionally, as in the case of a raw 8-bit data pipe connection, encoding conversion must be disabled. To do so, use this message to set both sides of the connection to the same PCM encoding format and no conversion will be performed.</p> |

| <b>Description</b>    | <p>This message is used to park one or both channels involved in a connection. This message disconnects two parties but does not tear down the connection.</p> <p>To park only one channel, enter the channel to be parked as both Channel A and Channel B in the AIB. When a channel is parked, it is not associated with any other channel and silence is transmitted to it. The channel may be used in a subsequent connection or released.</p> <p>When parking two channels, the host will receive a positive acknowledgment to this message for the first channel and a <i>DS0 Status Change</i> message with a channel status of “parked” for the second channel.</p> |

| <b>Description</b>          | <p><b>NOTE:</b> This message applies to the DSP Series 2 card only.</p> <p>Use this message to modify a current play file session. You can modify the gain and speed of the playback, pause or resume the playback, or skip forward or backward (in 100 ms increments) through the current file.</p> <p>When modifying a file that is playing to a conference, use the Conference AIB instead of the Channel AIB. If you are modifying a file that is playing to a conference, use the optional File ID TLV. If you use the File ID TLV, all instances of that File ID being played in the specified conference are modified. If the File ID TLV is absent, all the files playing into that conference are modified.</p> |

| <b>Description</b>          | <p><b>NOTE:</b> This message applies to the DSP Series 2 card only.</p> <p>Use this message to start playing a file.</p> <p>You can either specify the channel and the DSP Series 2 card, or let the Matrix Controller choose the DSP card by leaving the DSP slot set to 0xFF. The Matrix Controller reports back which DSP Series 2 card has been selected.</p> <p>If you are accessing files from an external server, you must send the <i>Generic Card Configure</i> message (0x0122) to set the Vocabulary Index File before you send this message, because you must identify a file's ID and location before you can play it. Internal recordings are an exception to this rule. Internal recordings can be played without having their IDs in the Vocabulary Index File.</p> <p>The <i>Play File Start</i> message may use File IDs from 0x00 to 0xFFFFFFFF. 0xFFFFFFFF is reserved by Cantata for internal use, except when using media streaming over RTP, when the range is up to 0x0100000.</p> <p>When recording a conference or playing a file to a conference, use the Conference AIB instead of the Channel AIB.</p> |

| <b>Description</b>          | <p><b>NOTE:</b> This message applies to the DSP Series 2 card only.</p> <p>Use this message to end a current play file session. The message may be used to cancel only play file requests that were made with the new <i>Play File Start</i> message.</p> <p>If you are stopping a play file to a conference (using the Conference ID AIB) you can use the File ID TLV. If File ID TLV is present, all instances of that file ID being played in the specified conference are stopped. If the File ID TLV is absent, all the files playing into that conference are stopped.</p> |

| <b>Description</b>    | <p>This message is sent by each Matrix Controller card to the host periodically, according to the poll interval.</p> <p>This message is also sent by each SS7 card (active and standby) to the SS7 local host periodically, according to the poll interval when interfaced by TCP/IP connections.</p> <p>The default interval for the Matrix Controller card is 2 seconds; it can be changed using the <i>Poll Interval Configure</i> message.</p> <p>The default interval for the SS7 card is 2 seconds; it can be changed using the <i>Poll Interval Configure</i> message.</p> <p>A <i>Poll</i> message is sent every time a state transition occurs. On transitions to the boot state, the poll may be delayed while the matrix or SS7 card resets. Every <i>Poll</i> message indicates the most recent matrix or SS7 card state transitions.</p> <p>The information in the <i>Poll</i> message is used by the host to detect that a matrix is attached to the host and that the communication link is functional. In a redundant system, information about the adjacent matrix or SS7 card state is also included. The host must use this information to properly communicate with the system.</p> <p>The ACK to this message can go to the standby Matrix controller card.</p> |

| 11              | Data<br>The data varies, depending on the Poll source.<br><br>The following data is reported if the Poll source is an Matrix Controller card, EXNET-ONE card, or EXNET Connect card.<br><br>Data[0] Card ID<br>This field indicates the Matrix Controller that is polling.<br>0x00 Right Matrix Controller (Slot 0x20)<br>0x01 Left Matrix Controller (Slot 0x21)<br><br>Data[1] Card State<br>This field indicates the most recent matrix state.<br>0x01 Booting<br>0x02 Initializing<br>0x03 Standby<br>0x04 Switching Over<br>0x05 Active |                 |                       |

**Data[2] Adjacent Card State**

This field indicates the most recent adjacent Matrix Controller state change. Changes in the adjacent Matrix Controller state should be considered as events at the host.

- 0x00 No adjacent Matrix Controller detected.
- 0x01 Adjacent Matrix Controller detected, cannot establish inter-matrix communications.
- 0x02 Adjacent Matrix Controller detected, inter-matrix communications established, and adjacent Matrix Controller cannot establish communications with the host.
- 0x03 Adjacent Matrix Controller detected, inter-matrix communications established, and adjacent Matrix Controller communicating with host.

**Data[3] Card Status**

This field is a bit mask. The meaning of each bit is as follows:

- Bit 0 Host Messaging**
  - 0 Receiving messages from host (at least 1 per 5-second interval)
  - 1 Not Receiving messages from the host
- Bit 1\* Download**
  - 0 Download not required
  - 1 Download required
- Bit 2 Active Ethernet Interface**
  - 0 Interface 1 Active
  - 1 Interface 2 Active
- Bit 3 Configuration**
  - 0 Ready for configuration messages
  - 1 Not ready for configuration messages
- Bit 4 Reserved**
- Bit 5 TFTP Download**
  - 0 Not In Progress
  - 1 In Progress
- Bits 6-7 Reserved**

\* If the Matrix Controller has system software, or if it can obtain it from the adjacent Matrix Controller, Bit 1 is "0". If Bit 1 is set, the host initiates a download of the system software. In some circumstances, both Matrix Controller cards indicate that they require system software to be downloaded. The Matrix Controller that receives its *Download Complete* message last will become the active Matrix Controller card.

**Data[4, 5] Reserved**

**Data[6, 7] Multi-Host Connection Status**

This field is a bit mask indicating the connection status of each host according to the previous *Poll* message sent by the CSP. If the *Poll* message was acknowledged by a specific host port, the corresponding bit is set to 1. If the *Poll* message was not acknowledged by a specific host, the corresponding bit is set to 0.

**NOTE:** Polling is operational only when the host is connected to Host Port 3142 and polling is enabled.

Status

0 - no *Poll* ACK received

1 - *Poll* ACK received

| <b>Description</b>    | <p>The poll interval is the time between <i>Poll</i> messages generated by the Matrix Controller card or other cards. A Matrix Controller card may generate <i>Poll</i> messages at any time to report Matrix Controller state changes. The default poll interval is two seconds. This message can also be sent from the host to an SS7 card to change the SS7 poll interval.</p> <p>The host can send this message to the active or standby Matrix Controller card.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14     | <p>Status Bits</p> <p>This field is a bit mask. The meaning of each bit is as follows:</p> <p>Bit 0 Host Messaging<br/> 0 Receiving messages from host (at least 1 per 5-second interval)<br/> 1 Not Receiving messages from the host</p> <p>Bit 1* Download<br/> 0 Download not required<br/> 1 Download required</p> <p>Bit 2 Reserved</p> <p>Bit 3 Configuration<br/> 0 Ready for configuration messages<br/> 1 Not ready for configuration messages</p> <p>Bit 4 Power Down<br/> 0 Ready for power down<br/> 1 Not ready for power down</p> <p>Bit 5 TFTP Download<br/> 0 Not In Progress<br/> 1 In Progress</p> <p>Bits 6-7 Reserved</p> <p>* If the matrix has system software, or if it can obtain it from the adjacent matrix, Bit 1 is "0". If Bit 1 is set, the host initiates a download of the system software. In some circumstances, both Matrix Controller cards indicate that they require system software to be downloaded. The Matrix Controller that receives its <i>Download Complete</i> message last will become the active Matrix Controller.</p> |

| :                   | PPL Protocol ID<br>Protocol IDs 1 - 10 are reserved per component for custom protocols. Shown below are two components and their default protocols that are included on the CSP. Default protocols are assigned through other methods such as <i>Trunk Type Configure</i> for the T1 protocols.<br><table><tr><th><u>Component ID</u></th><th><u>Protocol ID</u></th><th></th></tr><tr><td>Any</td><td>0x01–0x0A</td><td>Host-defined protocols</td></tr><tr><td rowspan="2">0x01 E1</td><td>0x0C*</td><td>ITU-T Compelled R2</td></tr><tr><td>0x0D</td><td>Clear</td></tr><tr><td rowspan="6">0x03 T1</td><td>0x0C*</td><td>E&amp;M</td></tr><tr><td>0x0D</td><td>FXS Loop Start</td></tr><tr><td>0x0E</td><td>FXS Ground Start</td></tr><tr><td>0x0F</td><td>FXO Loop Start</td></tr><tr><td>0x10</td><td>FXO Ground Start</td></tr><tr><td>0x11</td><td>Clear</td></tr><tr><td colspan="3">* default</td></tr></table> |                        |                       | <u>Component ID</u> | <u>Protocol ID</u> |  | Any | 0x01–0x0A | Host-defined protocols | 0x01 E1 | 0x0C* | ITU-T Compelled R2 | 0x0D | Clear | 0x03 T1 | 0x0C* | E&M | 0x0D | FXS Loop Start | 0x0E | FXS Ground Start | 0x0F | FXO Loop Start | 0x10 | FXO Ground Start | 0x11 | Clear | * default |  |  |

| <b>Type</b>           | EXS API and SwitchKit API message                                                                                                   |
| <b>Description</b>    | This message configures the PPL auditing features on a card. Use the <i>PPL Audit Query</i> host message to retrieve the audit log. |
| <b>Sent by</b>        | Host                                                                                                                                |

### SwitchKit Code Configuration

```
PPLAuditConfig (
 Node = integer,
 Slot = integer,
 V5ID = integer,
 ComponentID = integer,
 AuditType = integer,
 Span = integer,
 Channel = integer);
```

### C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 unsigned short ComponentID;
 UBYTE AuditType;
} XL_PPLAuditConfig;
```

### C++ Class

```
class XLC_PPLAuditConfig : public XLC_SlotMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 XBYTE getV5ID() const;
 void setV5ID(XBYTE x);
 unsigned short getComponentID() const;
 void setComponentID(unsigned short x);
 UBYTE getAuditType() const;
 void setAuditType(UBYTE x);
};
```

**EXS API Hex Format**

| <b>Description</b>    | <p>The host uses this message to request an audit for individual PPL components or entities. The CSP maintains two logs: the PPL state transition log and the PPL error log. Therefore, the host can use this message for two types of audits:</p> <ol style="list-style-type: none"> <li>1. PPL State Transition audit<br/>This audit retrieves information on a per-instantiated PPL component basis.</li> <li>2. PPL Error audit<br/>This audit retrieves information on a per-card basis.</li> </ol> <p>The response to this message is the PPL audit. Its contents, including the length of the audit entry, varies per PPL component.</p> <p>PPL component audits consist of one or more audit blocks, which in turn are made up of one or more audit entries. Each one of these messages queries one audit block. In order to audit a PPL component completely, the host must send several of these messages.</p> <p>When there are no audit entries remaining, the response status to the <i>PPL Audit Query</i> message will indicate 0x00D7 (End of PPL Audit Data).</p> <p>Prior to using this message, you must enable auditing using the <i>PPL Audit Configure</i> message.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Data[8, 9]   | PPL Error Status (MSB, LSB)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |                 |         |              |            |                      |         |               |         |            |            |                      |            |                             |         |         |            |                           |         |      |         |     |         |                 |         |              |            |                      |         |               |          |            |              |                      |              |                             |         |                 |         |              |            |                      |         |                                                                               |         |                                                                            |            |                      |            |                             |

For error audits, AIBs are retrieved for each audit entry.

If the value of the *Audit Type* field is 0x01, valid entries for the *Data* fields are as follows:

#### E1/T1 PPL Components

|         |                             |
|---------|-----------------------------|
| Data[0] | AIB                         |
| :       | :                           |
| Data[:] | PPL Protocol ID             |
| Data[:] | State Status                |
| Data[:] | PPL Event (MSB, LSB)        |
| Data[:] | Initial State               |
| Data[:] | Next State                  |
| Data[:] | Timestamp (MSB, LSB)        |
| Data[:] | PPL Error Status (MSB, LSB) |

#### ISDN/DASS 2 PPL Components

|         |                             |
|---------|-----------------------------|
| Data[0] | AIB                         |
| :       | :                           |
| Data[:] | Reserved                    |
| Data[:] | Call Reference (MSB, LSB)   |
| Data[:] | Reserved                    |
| Data[:] | Reserved                    |
| Data[:] | PPL Protocol ID             |
| Data[:] | State Status                |
| Data[:] | PPL Event (MSB, LSB)        |
| Data[:] | Initial State               |
| Data[:] | Next State                  |
| Data[:] | Timestamp (MSB, LSB)        |
| Data[:] | PPL Error Status (MSB, LSB) |

#### SS7 Components

The data begins with an AIB:

|         |                             |
|---------|-----------------------------|
| Data[0] | AIB                         |
| :       | :                           |
| Data[:] | PPL Protocol ID             |
| Data[:] | State Status                |
| Data[:] | PPL Event (MSB, LSB)        |
| Data[:] | Initial State               |
| Data[:] | Next State                  |
| Data[:] | Timestamp (MSB, LSB)        |
| Data[:] | PPL Error Status (MSB, LSB) |

If the value of the *Audit Type* field is **0x02**, valid entries for the *Data* fields are as follows:

#### E1/T1 PPL Components

|              |                                                                               |
|--------------|-------------------------------------------------------------------------------|
| Data[0]      | PPL Protocol ID                                                               |
| Data[1]      | State Status                                                                  |
| Data[2, 3]   | PPL Event (MSB, LSB)                                                          |
| Data[4]      | Initial State (If State value is greater than 255, this is truncated to 0xFF) |
| Data[5]      | Next State (If State value is greater than 255, this is truncated to 0xFF)    |
| Data[6, 7]   | Timestamp (MSB, LSB)                                                          |
| Data[8, 9]   | PPL Error Status (MSB, LSB)                                                   |
| Data[10, 11] | Extended Initial State (MSB, LSB)                                             |
| Data[12, 13] | Extended Next State (MSB, LSB)                                                |

#### ISDN/DASS 2 PPL Components

**State Status**

This byte indicates whether or not a blocking atomic function has been invoked by the state machine. A blocking atomic function is used for allocation of any off-board service resource required by the PPL.

Once the result of the resource request is received, the channel unblocks and resumes the remainder of the primitive. Blocking is performed on a channel basis without affecting other channels.

0x00    Normal  
0xFF    Blocking

**Timestamp**

The timestamp is an incrementing 10 ms timer representing the relative time between PPL events. After reaching the value of 0xFFFF, the timer resets to zero.

**PPL Error Status**

Valid entries for this word-length field are as follows:

0x0000 No Error  
0xF448 Invalid event for next state  
0xF447 Invalid event for initial state  
0xF446 Blocked message  
0xF445 Blocked event  
0xF444 Invalid event for blocked state  
0xF443 Internal error (wrong task ID)  
0xF442 Internal error (invalid header)  
0xF441 Internal error (invalid header)  
0xF440 Invalid event  
0xF43E Timer is disabled  
0xF43D Timer expired out of sequence  
0xF43C Event not processed  
0xF43B Internal error (invalid message)

0xF43A Cannot create new context  
 0xF439 Cannot enter new context  
 0xF438 Entering new context  
 0xF437 Leaving new context  
 0xF436 Invalid context  
 0xF435 No state/event list  
 0xF434 State machine suspended  
 0xF433 Timer expired while in blocked state  
 0xF432 Invalid response to blocked state  
 0xF431 Not waiting on internal event  
 0xF430 Initiated Channel purge  
 0xF42F Maximum iterations of state machine exceeded  
 0xF42E Null primitive  
 0xF42D Context is inconsistent  
 0xF42C Maximum nesting level exceeded  
 0xF42B Initiated state machine reset  
 0xF42A Maximum config byte offset exceeded  
 0xF429 Maximum number of GPRs exceeded  
 0xF420 Block Invalid Events  
 0xF41F Invalid Event Handler Activated

**Example Message**

This example shows a *PPL Audit Query* message that is being used to query a PPL State Transition audit log on logical span 0/channel 0, ISDN component #5. The message from the host to the CSP is as follows:

**Header:**

```
fe [00 16] [00 dd] 00 00 ff
```

**AIB:**

```
00 01 0D 03 00 00 00
```

**Info:**

```
[00 05] 00 00
```

| MESSAGE |                         |                          |

| <b>Description</b>    | This message is used to create a PPL protocol from previously downloaded state/event and primitive tables. The host assigns the protocol ID and uses it to identify the protocol in subsequent messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### SwitchKit Code C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 unsigned short ComponentID;
 UBYTE Entity;
} XL_PPLDataQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE AddrInfo[30];
 unsigned short ComponentID;
 UBYTE Entity;
 UBYTE ConfigData[218];
} XL_PPLDataQueryAck;
```

### C++ Class

```
class XLC_PPLDataQuery : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 XBYTE getSpan() const;
 void setSpan(XBYTE x);
 UBYTE getChannel() const;
```

```

void setChannel(UBYTE x);
UBYTE getSlot() const;
void setSlot(UBYTE x);
XBYTE getV5ID() const;
void setV5ID(XBYTE x);
unsigned short GetComponentID() const;
void setComponentID(unsigned short x);
UBYTE getEntity() const;
void setEntity(UBYTE x);
};

```

### C++ Class Response

```

class XLC_PPLDataQueryAck : public XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);

**NOTE 1** The following information shows calculations for the *number* of bytes in the Data, Start/End Range, and Mask fields. The actual data within these bytes varies.

1. Convert Criteria Data Length to decimal value.
2. If Route Property = 0x01
$$a = \text{number of bytes in Data} = \text{Criteria Data Length} / 2$$

$$b = \text{number of bytes in Mask} = \text{Criteria Data Length} / 2$$
3. If Route Property = 0x02,
$$x = \text{number of bytes in Start Range} = \text{Criteria Data Length} / 3$$

$$y = \text{number of bytes in End Range} = \text{Criteria Data Length} / 3$$

$$z = \text{number of bytes in Mask} = \text{Criteria Data Length} / 3$$

**NOTE 2** The following information shows calculations for the *number* of bytes in the Data, Start/End Range, and Mask fields. The actual data within these bytes varies.

1. Convert Criteria Data Length to decimal value.
2. If Route Property = 0x01
$$a = \text{number of bytes in Data} = (\text{Criteria Data Length} - 6) / 2$$

$$b = \text{number of bytes in Mask} = (\text{Criteria Data Length} - 6) / 2$$
3. If Route Property = 0x02,
$$x = \text{number of bytes in Start Range} = (\text{Criteria Data Length} - 6) / 3$$

$$y = \text{number of bytes in End Range} = (\text{Criteria Data Length} - 6) / 3$$

$$z = \text{number of bytes in Mask} = (\text{Criteria Data Length} - 6) / 3$$

If the response data cannot be sent by the CSP in one message, you must resend the message, incrementing the range, until a response status of 0xD7 is returned.

### **Criteria Type entries**

0x0001 Address Digits 1  
0x0002 Address Digits 2  
0x0003 Address Digits 3  
0x0004 Address Digits 4  
0x0005 User-defined  
0x0006 Route Group ID  
0x0007 Incoming Span/Channel  
0x0010 Incoming Resource Group  
0x001A Incoming Node ID

### **Universal Protocol Data**

A Universal Protocol is one of the options that can be used when defining a particular Criteria Type. You must distinguish between UDP and other possible entries to accurately show the data contained in the Route Tables.

| <b>Description</b>    | <p>This message allows the host to delete a protocol, a primitive table, or a state/event table. A primitive or state/event table is not be deleted if it is associated with a protocol in use. All channels must be out-of-service.</p> <p>If the host sends this message to a CSP that has multiple line cards of the same type, the system deletes the protocol only if the protocol is not in use by every card. If the PPL protocol is in use by at least one card, the system returns a <i>Channel In Service</i> (0xD5) response and does not delete the channel.</p> <p>You can delete all downloaded PPL components by specifying the PPL component 0xFFFF, which is valid for this message only. Using this value has the following effects:</p> <ul style="list-style-type: none"> <li>• For E1 and T1 cards and matrices (L4PPL), the system deletes all downloaded PPLs and purges all channels using non-default protocols.</li> <li>• For ISDN and SS7 cards, the system deletes all downloaded PPLs. If any channel (D/B channel, SS7 link, and so on) is using a non-default protocol <b>and</b> is in service, the system resets the card; however, if no channels are in service, the system does not reset the card.</li> </ul> |

## PPL Event Indication 0x0043

---

**SwitchKit Name** PPLEventIndication

**Type** EXS API and SwitchKit API message

**Description** This message is sent by a PPL component to report an event to the host with optional ICB data.

**NOTE:** All PPL Event Indication messages that originate with the CIC PPL component will have the new Virtual CIC AIB.

**Sent by** CSP

**Example Message (Socket Log Output for SwitchKit)** In this example, the CSP informs the host of an incoming SIP REGISTER message:

00 0B 00 43 00 00 FF 7F 00 A7 00 0A 00

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE AddrInfo[30];
 unsigned short ComponentID;
 unsigned short PPLEvent;
 UBYTE ICBCount;
 UBYTE Data[218];
} XL_PPLEventIndication;
```

### C++ Class

```
class XLC_PPLEventIndication : public XLC_InboundMessage
{
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 XBYTE getSpan() const;
 void setSpan(XBYTE x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getStackID() const;
 void setStackID(UBYTE x);
 UBYTE getLinkID() const;
 void setLinkID(UBYTE x);
 XBYTE getV5ID() const;
 void setV5ID(XBYTE x);
 unsigned short getComponentID() const;
 void setComponentID(unsigned short x);
 unsigned short getPPLEvent() const;
 void setPPLEvent(unsigned short x);
 UBYTE getICBCount() const;
 void setICBCount(UBYTE x);
 const UBYTE *getData() const;
```

```

UBYTE *getData();
void setData(UBYTE *x);
};

```

**Data For SS7 MTP Message Tracing:**

ICB Data Length n (variable)

Data [0]First byte of MSU Data

Data [n]End of MSU Data

**NOTE:** If ICB length is more than 200 bytes the following applies.  
For example: ICB Data Length is 450 bytes:

- a. Then the first frame will be sent with the first 200 bytes of MSU Data with PPL Event Indication as  
0x20: "SS7 MTP Message Tracing Not Last".

- b. The second frame will be sent with the next 200 bytes of MSU Data with PPL Event Indication as 0x20: "MTP Message Tracing Not Last".
- c. The third frame will be sent with the next 50 bytes of MSU Data with PPL Event Indication as 0x21: "MTP Message Tracing Last".

The length and content of the data varies according to the ICB subtype. A list of valid ICBs appears in the *API Reference*.

### ICB Data Length/Data

The following tables show the data length and format for each ICB subtype that includes data.

### Response Status

If the MSB of the Status field is 0x50 (NACK), the LSB indicates the NACK reason.

0x01 Invalid module type for DPC/Stack/CICcombination.

**Example:** Host has sent a *Service State Configure* message with invalid DPC/Stack/CIC.

0x02 Message received for unassigned CIC.

**Example:** Host has sent a *PPL Event Request* for unassigned CIC.

0x03 Only Extended API is supported for VCIC.

## PPL Event Request 0x0044

---

| <b>SwitchKit Name</b> | PPLEventRequest                                                                                                         |
| <b>Type</b>           | EXS API and SwitchKit API message                                                                                       |
| <b>Description</b>    | This message is sent to initiate a host event on a PPL component with optional ICB data.                                |
|                       | <b>NOTE:</b> All PPL Event Indication messages that originate with the CIC PPL component will have the Virtual CIC AIB. |
| <b>Sent by</b>        | Host                                                                                                                    |

**Sample Message** In this sample, the host accepts a SIP registration request.  
00 0B 00 44 00 00 FF 7F 00 A7 00 0A 00

### SwitchKit Code Configuration

```
PPLEventRequest (
 Node = integer,
 Span = integer,
 Channel = integer,
 Subrate = integer,
 StackID = integer,
 LinkID = integer,
 Destination = integer,
 Route = integer,
 NumChannels = integer,
 V5ID = integer,
 TCAPStackID = integer,
 SSN = integer,
 ComponentID = integer,
 PPLEvent = integer,
 ICBCount = integer,
 Data = byte array);
```

### C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 unsigned short ComponentID;
 unsigned short PPLEvent;
 UBYTE ICBCount;
 UBYTE Data[218];
} XL_PPLEventRequest;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE reserved6[13];
 UBYTE Data[251];
} XL_PPLEventRequestAck;
```

**C++ Class**

```

class XLC_PPLEventRequest : public XLC_OutboundMessage {
public:
